whereupon the mixture was evaporated under reduced pressure. The residue was dissolved in dichloromethane (500 cm<sup>3</sup>) and washed with a saturated solution of sodium hydrogencarbonate (2 x 200 cm<sup>3</sup>). The aqueous phase was extracted using continuous extraction for 12 h and the combined extract was dried (Na<sub>2</sub>SO<sub>4</sub>) and 5 evaporated. The residue was purified by silica gel column chromatography using dichloromethane/methanol (99:1, v/v) as eluent to give furanose 20 as a white solid material (3.24 g, 75%). δ<sub>H</sub> (CDCl<sub>3</sub>) 5.84 (1H, d, J 3.7, 1-H), 5.74 (1H, dd, J 11.0, 17.2, 1'-H), 5.52 (1H, dd, J 1.6, 17.1, 2'-H<sub>a</sub>), 5.29 (1H, dd, J 1.3, 11.0, 2'-H<sub>b</sub>), 4.21 (1H, d, J 3.7, 2-H), 3.98 (1H, t, J 5.7, 4-H), 3.68-3.64 (2H, m, 5-H<sub>a</sub>, 5-H<sub>b</sub>), 2.88 (1H, 10 s, 3-OH), 1.99 (1H, t, J 6.3, 5-OH), 1.60 (3H, s, CH<sub>3</sub>), 1.35 (3H, s, CH<sub>3</sub>). δ<sub>C</sub> (CDCl<sub>3</sub>) 133.6 (C-1'), 116.2 (C-2'), 113.0 (C(CH<sub>3</sub>)<sub>2</sub>), 103.8 (C-1), 83.4, 82.4 (C-4, C-2), 79.6 (C-3), 61.3 (C-5), 26.5, 26.4 (CH<sub>3</sub>).

15 **3,5-Di-O-benzyl-1,2-O-isopropylidene-3-C-vinyl-α-D-ribofuranose (21).** A 60% suspension of sodium hydride (w/w, 1.78 g, 44.5 mmol) in anhydrous DMF (50 cm<sup>3</sup>) was stirred at 0 °C and a solution of furanose 20 (3.20 g, 14.8 mmol) in anhydrous DMF (35 cm<sup>3</sup>) was added dropwise over 30 min. The mixture was stirred at 50 °C for 1 h and subsequently cooled to 0 °C. A solution of benzyl bromide (5.3 mL, 44.5 mmol) in anhydrous DMF (5.3 cm<sup>3</sup>) was added dropwise, and the mixture was stirred at room temperature for 20 h. The reaction mixture was evaporated and redissolved in dichloromethane (300 cm<sup>3</sup>), washed with saturated aqueous sodium hydrogen-carbonate (3 x 200 cm<sup>3</sup>) and dried (Na<sub>2</sub>SO<sub>4</sub>). The solvents were removed under reduced pressure and the residue was purified by silica gel column chromatography 20 using petroleum ether/ethylacetate (9:1, v/v) as eluent to give furanose 21 as a white solid material (5.36 g, 91%). δ<sub>H</sub> (CDCl<sub>3</sub>) 7.40-7.26 (10H, m, Bn), 5.90 (1H, d, J 3.6, 1-H), 5.72 (1H, dd, J 11.1, 17.9, 1'-H), 5.41 (1H, dd, J 0.7, 11.1, 2'-H<sub>a</sub>), 5.30 (1H, dd, J 0.5, 17.8, 2'-H<sub>b</sub>), 4.70-4.45 (6H, m, Bn, 2-H, 4-H), 3.69 (1H, dd, J 2.6, 10.8, 5-H<sub>a</sub>), 3.50 (1H, dd, J 7.9, 10.9, 5-H<sub>b</sub>), 1.64 (3H, s, CH<sub>3</sub>), 1.40 (3H, s, CH<sub>3</sub>). δ<sub>C</sub> (CDCl<sub>3</sub>) 138.6, 138.3 (Bn), 134.5 (C-1'), 128.3-127.4 (Bn), 118.2 (C-2'), 112.9 (C(CH<sub>3</sub>)<sub>2</sub>), 104.7 (C-1), 84.7, 81.1, 81.0 (C-2, C-3, C-4), 73.3 (C-5), 69.4, 67.0 (Bn), 26.8, 26.6 (CH<sub>3</sub>).

**Example 23**

**1,2-Di-O-acetyl-3,5-di-O-benzyl-3-C-vinyl- $\alpha,\beta$ -D-ribofuranose (22).** A solution of furanose **21** (4.40 g, 11.1 mmol) in 80% aqueous acetic acid (50 cm<sup>3</sup>) was stirred at 90 °C for 8 h. The solvents were removed and the residue was coevaporated with 5 99% ethanol (3 x 25 cm<sup>3</sup>), toluene (3 x 25 cm<sup>3</sup>) and anhydrous pyridine (2 x 25 cm<sup>3</sup>) and redissolved in anhydrous pyridine (20 cm<sup>3</sup>). Acetic anhydride (17 cm<sup>3</sup>) was added and the solution was stirred at room temperature for 48 h. The reaction was quenched with ice-cold water (100 cm<sup>3</sup>) and extracted with dichloromethane (2 x 100 cm<sup>3</sup>). The combined extract was washed with saturated aqueous sodium hydrogencarbonate (3 10 x 100 cm<sup>3</sup>) and dried (Na<sub>2</sub>SO<sub>4</sub>). The solvent was evaporated and the residue was purified by silica gel column chromatography using petroleum ether/ethylacetate (4:1, v/v) as eluent to give furanose **22** as an oil (4.27 g, 87%,  $\alpha:\beta \sim 1:1$ ). δ<sub>c</sub> (CDCl<sub>3</sub>) 169.9, 169.8 (C=O), 139.0, 138.6, 138.0, 137.8 (Bn), 133.3, 132.4 (C-1'), 128.4- 15 126.8 (Bn), 119.6, 119.5 (C-2'), 99.5, 94.0 (C-1), 85.4, 85.0, 84.3, 83.6, 77.7, 73.6, 73.5, 73.3, 70.0, 69.2, 67.5, 67.2 (C-2, C-3, C-4, C-5, Bn), 21.0, 20.9, 20.6, 20.4 (CH<sub>3</sub>).

**Example 24**

**1-(2-O-Acetyl-3,5-di-O-benzyl-3-C-vinyl- $\beta$ -D-ribofuranosyl)thymine (23).** To a stirred 20 solution of compound **22** (4.24 g, 9.6 mmol) and thymine (2.43 g, 19.3 mmol) in anhydrous acetonitrile (100 cm<sup>3</sup>) was added N,O-bis(trimethylsilyl)acetamide (11.9 cm<sup>3</sup>, 48.1 mmol). The reaction mixture was stirred at reflux for 30 min. After cooling to 0 °C, trimethylsilyl triflate (3.2 cm<sup>3</sup>, 16.4 mmol) was added dropwise and the 25 solution was stirred for 24 h at room temperature. The reaction was quenched with cold saturated aqueous sodium hydrogencarbonate (100 cm<sup>3</sup>) and the resulting mixture was extracted with dichloromethane (3 x 50 cm<sup>3</sup>). The combined extract was washed with saturated aqueous sodium hydrogencarbonate (2 x 50 cm<sup>3</sup>) and brine (2 x 50 cm<sup>3</sup>) and dried (Na<sub>2</sub>SO<sub>4</sub>). The extract was evaporated under reduced pressure and the residue was purified by silica gel column chromatography using dichloro- 30 methane/methanol (99:1, v/v) as eluent to give nucleoside **23** as a white foam (4.03 g, 83%). δ<sub>H</sub> (CDCl<sub>3</sub>) 8.78 (1H, br s, NH), 7.75 (1H, s, 6-H), 7.38-7.26 (10 H, m, Bn), 6.49 (1H, d, J 8.1, 1'-H), 5.99-5.88 (2H, m, 2'-H and 1''-H), 5.54-5.48 (2H, m, 2''-H<sub>a</sub>, 2''-H<sub>b</sub>), 4.91-4.50 (4H, m, Bn), 4.34 (1H, s, 4'-H), 3.80 (1H, m, 5'-H<sub>a</sub>), 3.54 (1H, m, 5'-H<sub>b</sub>), 2.11 (3H, s, COCH<sub>3</sub>), 1.48 (3H, s, CH<sub>3</sub>). δ<sub>c</sub> (CDCl<sub>3</sub>) 170.1 (C=O), 163.8

**Alternative preparation of compound 50. G1AQ.** To a suspension of compound **78** (1.5g, 2.51 mmol), N2-isobutyrylguanine (0.93 g, 4.06 mmol) in dry DCM (50 mL) was added BSA (N,O-bistrimethylsilylacetamide; 3.33 mL, 13.5 mmol) and the mixture was refluxed for 2 h. Trimethylsilyl triflate (1.25 mL, 6.9 mmol) was added to the mixture 5 and refluxing was continuing for additional 2 h. The mixture was allowed to cool to room temperature, diluted by 200 mL of DCM and washed by saturated aq. NaHCO<sub>3</sub> and water. Chromatography at silica gel column (1- 2.5 % of CH<sub>3</sub>OH in dichloromethane) yielded 1.05g (55%) of the desired isomer **G1AQ** and 380 mg of isomers with higher mobility which was converted to **G1AQ** by repetition of the procedure 10 described above. Ammonium hydroxide (12 mL of 25% aq. solution) was added to a solution of **G1AQ** (1.05 g in 12 mL of methanol) and the mixture was stirred for 1hr at room temperature. After concentration, the product was purified by silica gel column chromatography (1-3 % CH<sub>3</sub>OH in dichloromethane) to give 700 mg **G3** as a white solid material. 700 mg of **G3** in anhydrous THF (15 mL) was treated with NaH (225 15 mg of 60% suspension in mineral oil). 30 min later, the reaction was quenched by addition of 1.25 mL of acetic acid, and the mixture was concentrated under reduced pressure. The residue was dissolved in dichloromethane, washed by NaHCO<sub>3</sub> and water and purified by silica gel chromatography in gradient 0.5-3% methanol/DCM. Yield 400 mg (75%) of **50**.

The combined organic phase was evaporated under reduced pressure and the residue was redissolved in dioxane ( $4 \text{ cm}^3$ ), whereupon 32% aqueous ammonia ( $0.7 \text{ cm}^3$ ) was added. After stirring for 3 h, the reaction mixture was evaporated under reduced pressure and coevaporated with anhydrous pyridine. The residue was dissolved in anhydrous pyridine ( $3.6 \text{ cm}^3$ ) and benzoyl chloride ( $0.42 \text{ cm}^3$ , 3.6 mmol) was added. After stirring for 2 h, the reaction was quenched with water ( $1 \text{ cm}^3$ ) and the reaction mixture was evaporated under reduced pressure. The residue was then redissolved in EtOAc and washed with water ( $3 \times 7 \text{ cm}^3$ ). The organic phase was evaporated to dryness under reduced pressure, and the residue was dissolved in pyridine/methanol/water (13:6:1, v/v/v,  $14 \text{ cm}^3$ ) at  $0^\circ\text{C}$ , and a 2M solution of NaOH in pyridine/methanol/water (13:6:1, v/v/v,  $7 \text{ cm}^3$ ) was added. After stirring for 20 min, the reaction mixture was neutralised using a 2M solution of HCl in dioxane, and the reaction mixture was evaporated under reduced pressure. The residue was purified by silica column chromatography using dichloromethane/methanol (95:5, v/v) as eluent to give nucleoside **65** as a yellow foam (94.6 mg, 38%).  $\delta_{\text{H}}$  ( $\text{CD}_3\text{OD}$ ) 8.21 (1H, br, s), 8.02 (1H, m), 7.84-7.9 (1H, m), 7.41-7.58 (4H, m), 5.61 (1H, s), 4.36 (1H, s), 4.10 (1H, s), 3.98 (1H, d,  $J$  8.0), 3.94 (2H, s), 3.78 (1H, d,  $J$  7.9), 2.11 (3H, d,  $J$  1.0).  $\delta_{\text{c}}$  ( $\text{CD}_3\text{OD}$ , selected signals) 133.66, 132.90, 130.63, 129.50, 129.28, 128.65, 90.71, 88.86, 80.57, 72.47, 70.22, 57.53, 14.01. To a stirred solution of nucleoside **65** (82 mg, 0.22 mmol) in anhydrous pyridine ( $1.5 \text{ cm}^3$ ) was added 4,4'-dimethoxytrityl chloride (80 mg, 0.24 mmol) and stirring was continued at room temperature for 12 h. Additional 4,4'-dimethoxytrityl chloride (80 mg, 0.24 mmol) was added, and stirring was continued for another 12 h. Methanol ( $0.5 \text{ cm}^3$ ) was added and the reaction mixture was evaporated under reduced pressure. The residue was subjected to silica gel column chromatography using dichloromethane/methanol/pyridine (98.5:1.0:0.5, v/v/v). The resulting intermediate (FAB-MS  $m/z$  676) (50.2 mg) was coevaporated with anhydrous

acetonitrile and dissolved in anhydrous dichloromethane (0.62 cm<sup>3</sup>). *N,N*-Diisopropyl-ethylamine was added (0.1 cm<sup>3</sup>) followed by addition of 2-cyanoethyl *N,N*-diisopropyl-phosphoramidochloridite (0.3 cm<sup>3</sup>, 0.11 mmol). After stirring for 3 h at room temperature, water (1 cm<sup>3</sup>) was added and the resulting mixture was diluted with 5 ethylacetate (10 cm<sup>3</sup>), washed with saturated aqueous solutions of sodium hydrogen-carbonate (3 × 6 cm<sup>3</sup>) and brine (3 × 6 cm<sup>3</sup>). The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated under reduced pressure. The residue was purified by silica gel column HPLC. **9-(4-(Hydroxymethyl)-2,3-*O*-isopropylidene-β-*D*-ribofuranosyl)-6-*N*-benzoyladenine (67).** A mixture of oxalyl chloride (0.93 mL, 10.75 mmol) and dichloromethane (25 mL) was cooled to -70°C. Dimethyl sulfoxide (DMSO, 1.7 mL, 22 mmol) was added 15 drop-wise under intensive stirring. The mixture was stirred for 10 min at -70°C and a solution of 9-(2,3-*O*-isopropylidene-β-*D*-ribofuranosyl)-6-*N*-benzoyladenine (3.4 g, 8.27 mmol) in dimethylsulfoxide/dichloromethane (1:9 v/v, 20 mL) was added during 5 min. The mixture was stirred at -60°C for 30 min. Triethylamine (7 mL, 50.3 mmol) was added and the mixture was allowed to warm to room temperature. The solution was 20 diluted by dichloromethane (50 mL) and washed by water (3 × 100 mL). Water fractions were additionally washed by 100 mL of dichloromethane. The organic phase was concentrated to an oily mass, co-evaporated with dioxane (50 mL) and re-dissolved in 30 mL of dioxane. 37% aq. formaldehyde (2.95 mL, 33.4 mmol) and 2M aq. NaOH (8.26 mL) were added; the mixture was stirred at room temperature for 10 25 min and cooled to 0°C. Sodium borohydride (640 mg, 16.9 mmol) was added and the reaction mixture was allowed to warm to room temperature during 15 min. The reaction was quenched by addition of acetic acid (5 mL) and to the mixture was added dichloromethane and a saturated aqueous solution of sodium hydrogen carbonate (100 mL each). The organic phase was washed with water (100 mL), concentrated *in* 30 *vacuo* and the product was isolated by column (2.5 × 25 cm) silica gel chromatography by the use of 2 - 3.2 % of methanol in dichloromethane (v/v) as eluent. - 5 Alternative synthesis of 67. To a solution of 2',3'-O-isopropylideneadenosine (15 g) in anhydrous pyridine (250 mL) was added trimethylsilyl chloride (15.5 mL). The reaction mixture was stirred at room temperature for 20 min and cooled to 0 °C. Benzoyl chloride (17 mL) was added drop-wise and the mixture was kept at room temperature for 2-3 h. Water (50 mL) and 25 % aq. ammonium hydroxide (100 mL)
- 10 was added and stirring was continued for 3 h. Then the mixture was concentrated under reduced pressure, co-evaporated with toluene (2 x 200 mL) and dichloromethane (DCM) and saturated sodium hydrogencarbonate was added. The organic phase was evaporated to dryness to give a yellow solid. Recrystallisation from ethanol resulted in 12.5 g (ca 80 %) as a white solid intermediate material. Oxalyl chloride
- 15 (4.68 mL) in dry DCM (120 mL) was cooled to -70° C. DMSO (8.5 mL) was added during intensive stirring. Later (10 min) a solution of the intermediate for which the synthesis is described above (17 g) in 10% DMSO/DCM (100 mL) added dropwise (20 min). The temperature was allowed to increase to -50° C over a period of 30 min after which the reaction was quenched with triethylamine (35 mL). To the mixture
- 20 was added DCM (200 ml) which was washed with water (3 x 200 mL). The intermediate was concentrated *in vacuo*, co-evaporated with dioxane, and redissolved in dioxane (120 mL). Formaldehyde (37 %) and 2 M aq. sodium hydroxide (40 mL) was added and the reaction mixture was stirred for 1 h. The mixture was neutralised with acetic acid (6 mL) and DCM (400 ml) and saturated sodium hydrogencarbonate
- 25 (400 mL) were added. The organic phase was concentrated. The product 67 was purified by column chromatography (silica gel, 1.5 - 5.0 % methanol/ DCM). Yield 8.5 g (46 %) of 67. Data were as stated earlier in this example.

25 **3-O-Benzyl-1,2:5,6-di-O-isopropylidene- $\alpha$ -D-glucofuranose (30B).** To a solution of 1,2:5,6-Di-O-isopropylidene- $\alpha$ -D-allofuranose (**30A**) (obtained from Pfanstiehl Laboratories Inc.) (40 g) in dimethylformamide at 0 °C was added sodium hydride in smaller portions. The reaction mixture was stirred for 1 h, benzyl bromide was added drop wise over a period of 1 h. The reaction mixture was stirred at room temperature 30 for 16 h. Methanol was added to quench the reaction and dimethylformamide was removed under pressure. The syrup was extracted with ethyl acetate and washed with brine. Evaporation of the ethyl acetate layer yielded a semisolid (93%). Homogeneous by TLC.

**3-O-Benzyl-1,2-O-isopropylidene- $\alpha$ -D-glucofuranose (30C).** Partial hydrolysis of 30B

(50 g) was achieved in 75 % acetic acid in a period of 20 h. Concentration to a smaller volume and extraction with ethyl acetate yielded 30C, 40 g, (90 %).

Homogeneous by TLC.

**3-O-Benzyl-1,2-O-isopropylidene- $\alpha$ -D-ribo-pentodialdofuranose (30D).** A solution of 30C (40 g) in water/methanol (1:1) was slowly added with stirring to a solution of sodium periodate in water at 0 °C. The reaction was stirred for 2 h, ethylene glycol was added and the mixture was extracted with ethyl acetate. The dried extract was evaporated to yield 30D, 32 g, (89%). Homogeneous by TLC. In this step addition of methanol is essential for the completion of the reaction.

**3-O-Benzyl-4-(hydroxymethyl)-1,2-O-isopropylidene- $\alpha$ -D-erythro-pentofuranose (30E).**

Aqueous 37 % formaldehyde and 1N sodium hydroxide were added at 0 °C to a 15 stirred solution of 30D (32 g) in water and tetrahydrofuran (1:1), the reaction was continued for 16 h, extracted in ethyl acetate and washed with brine. Evaporation of the organic layer afforded a syrup which crystallised from ether/petroleum ether as white solid, 23 g, the filtrate was an oil which solidified as a low melting solid, 10 g, total yield of 30E, 92%. [23 g (white solid was 99 % pure by TLC), 10 g of low 20 melting solid (had faster moving impurities by TLC, approximately 75% pure)]. In this step addition of tetrahydrofuran is very important for the time and reaction completion.

**3,5-Di-O-benzyl-4-C-hydroxymethyl-1,2-O-isopropylidene- $\alpha$ -D-ribofuranose (31).**

25 Benzylation of 30E (20 g) with NaH 60 % and BnBr at -10°C yielded a mixture of two isomers. Flash column chromatography afforded 31 as the major isomer, 14 g, (54%). Homogeneous by TLC.

**3,5-Di-O-benzyl-1,2-O-isopropylidene-4-C-tosyl- $\alpha$ -D-ribofuranose (77).** A solution of 31

30 (12.5 g) in pyridine at 0 °C was treated with p-toluenesulphonyl chloride and the reaction was continued at room temperature for 14-16 h. Removal of pyridine, extraction with methylene chloride and saturated bicarbonate solution afforded 77, 14 g, (80%). Homogeneous by TLC.

**1,2-di-O-acetyl-3,5-di-O-benzyl-4-C-tosyl-D-ribofuranose (78).** Hydrolysis of 77 (14 g) was done in 75% acetic acid at 65 °C for 18 h. The solvent was removed under pressure and the residue was treated with ethanol (3x100), toluene (3x50) and anhydrous pyridine (2x50). (This compound 78 crystallised from petroleum ether as fine white solid.) The residue was taken in dry pyridine and treated with acetic anhydride at room temperature for 8 h. Extraction with ethyl acetate and saturated bicarbonate followed by washing with brine afforded 78 as a mixture of  $\alpha$  and  $\beta$  anomers, 12g, (83%). A direct comparison with an authentic sample of 78 (TLC, HPLC, NMR) confirmed its identity and purity.

- 10 7-hydroxy-2,5-dioxabicyclo {2.2.1} heptane]. LNA-C (formula Z) was taken in absolute ethanol and heated at reflux. To the refluxing solution, benzoic anhydride (2 equivalents) was added and the reaction was followed by HPLC (Eluant: 20% acetonitrile in 0.1M TEAA, pH 7.0, flow rate: 1ml/min., Novapak C-18 analytical column). Additional anhydride was added at 0.5-2h intervals till no more increase in  
15 product was observed by HPLC. Reaction mixture was concentrated on rotavap. Residue was repeatedly washed with ether, filtered and dried to give an off white solid. Yield: 45%.

General method for dimethoxytritylation of base protected LNA nucleosides (LNA-C<sup>Bz</sup>,

- 20 LNA-T, LNA-G<sup>Bz</sup>, LNA-A<sup>Bz</sup>). Base protected LNA-nucleoside was coevaporated with pyridine (2x) and was stirred with dimethoxytrityl chloride (1.5 equivalents) in pyridine (~10 ml/g of nucleoside). The reaction was followed by HPLC (50% acetonitrile in 0.1M TEAA, pH 7.0, for 5 min., 50-100% acetonitrile in 10 min. and 100% acetonitrile for 5 min., flow rate: 1 ml/min., Novapak C-18 column). When >95% of  
25 the starting material had reacted, reaction mixture was cooled in ice. Reaction was quenched by addition of cold saturated NaHCO<sub>3</sub> (~15 ml x vol. of pyridine). The mixture was extracted with dichloromethane (3 x half the vol. of sodium bicarbonate). Organic extractions were combined, dried over anhydrous sodium sulfate, filtered and concentrated on rotavap. Residue was dried *in vacuo* and purified by silica gel  
30 chromatography using 0.5% pyridine and 0-2% methanol in dichloromethane as eluant. Fractions containing pure products were combined and concentrated on rotavap. Residue was coevaporated with anhydrous acetonitrile (3x) and dried *in vacuo*.

**General method for phosphitylation of protected LNA nucleosides.** Base protected dimethoxytrityl-LNA nucleoside was coevaporated with anhydrous dichloromethane (2x) and was taken in anhydrous dichloromethane (10 ml/g of nucleoside for A,G & T and ~30 ml/g for C). To this bis(diisopropylamino)(2-cyanoethyl)phosphite (1.05-1.10 equivalent), followed by tetrazole (0.95 equivalent) were added. Mixture was stirred at room temperature and reaction was followed by HPLC (70% acetonitrile in 0.1M TEAA, pH 7, 2 min., 70-100% acetonitrile in 8 min., and 100% acetonitrile in 5 min., flow rate: 1 ml/min., Novapak C-18 column). Once the reaction had proceeded to >90% and no more increase in amidite formation was observed upon further stirring, the mixture was cooled in ice. It was diluted with dichloromethane (~15-20 times the original volume) and washed with cold saturated sodium bicarbonate (2x) followed by cold brine (1x). Organic layer was dried over anhydrous sodium sulfate, filtered and concentrated on rotavap. Residue was coevaporated with anhydrous acetonitrile (3x) and dried *in vacuo* overnight. HPLC purity ranged from 93-98%.

#### Preparation of LNA nucleoside 5'-triphosphates

##### Example 123

###### Synthesis of LNA nucleoside 5'-triphosphates. (*Tetrahedron Letters* 1988, 29 4525).

In a 13x100 mm polypropylene tube, nucleosides 37, 44, 51, 4-N-benzoylated 57A or 61B (93.8  $\mu$ mol) was suspended in 1 mL pyridine (dried by  $\text{CaH}_2$ ). The solution was evaporated in a speedvac, under high vacuum, to dryness. The residue was twice resuspended in acetonitrile (dried by  $\text{CaH}_2$ ) and evaporated to dryness. The nucleoside was suspended in 313  $\mu$ L trimethyl phosphate (dried by 4 $\text{\AA}$  molecular sieves), to which 30.1 mg Proton Sponge™ (1.5 equivalents) were added. The mixture was sealed, vortexed, and cooled to 0° C.  $\text{POCl}_3$  (9.8  $\mu$ L, 1.1 equivalent) was added with vortexing. The reaction was allowed to proceed at 0°C for 2.5 hours. During this interval, 469  $\mu$ moles sodium pyrophosphate (5 equivalents) were dissolved in 5 mL water and passed through 5 mL Dow 50 H<sup>+</sup> ion exchange resin. When the effluent turned acidic, it was collected in 220 $\mu$ L tributylamine and evaporated to a syrup. The TBA pyrophosphate was coevaporated three times with dry acetonitrile. Finally, the dried pyrophosphate was dissolved in 1.3 mL DMF (4 $\text{\AA}$  sieves). After 2.5 hours reaction time, the TBA pyrophosphate and 130  $\mu$ L tributylamine were added to the nucleoside solution with vigorous vortexing. After 1 minute, the reaction was

quenched by adding 3 mL 0.1 M triethylammonium acetate, pH 7.5. Assay by Mono Q chromatography showed 49% nucleoside 5'-triphosphate. The reaction mixture was diluted to 100 mL with water and adsorbed onto a Q Sepharose ion exchange column, washed with water, and eluted with a linear gradient of 0 to 700 mM NaCl in 5 mM sodium phosphate, pH 7.5. Fractions containing triphosphate were assayed by Mono Q ion exchange chromatography. Fractions containing triphosphate were pooled and concentrated to the point of NaCl saturation. The product was desalted on a C<sub>18</sub> cartridge. The triphosphate was quantitated by UV spectroscopy and adjusted to 10 mM solution. Yields were 17 - 44%. LNA nucleosides prepared by this method were,

10 U, T, A, G, and C.

#### Preparation of LNA modified oligonucleotides

##### Example 124

15 Synthesis of oligonucleotides containing LNAs of formula V, X, Y and Z<sup>T</sup>, Z<sup>U</sup>, Z<sup>G</sup>, Z<sup>C</sup>, Z<sup>A</sup>, Z<sup>M+C</sup>. The bicyclic nucleoside 3'-O-phosphoramidite analogues 8, 19, 30, 39, 46, 53, 57D, 61D, and 66 as well as commercial 3'-O-phosphoramidites were used to synthesise example LNA oligonucleotides of the invention (0.2 to 5 µmol scale) containing one or more of the LNAs of types V, X, Y and Z<sup>T</sup>, Z<sup>U</sup>, Z<sup>G</sup>, Z<sup>C</sup>, Z<sup>A</sup>, and Z<sup>M+C</sup>.

20 The purity and composition of the synthesised LNA oligonucleotides was verified by capillary gel electrophoresis, and/or HPLC and/or MALDI-MS. In general, satisfactory coupling efficiencies were obtained for all the monomers. The best coupling efficiencies (~95-100%) were obtained for LNAs 39, 46, 53, 57D, 61D, and 66 (leading to LNA monomers of formula Z) giving very satisfactory results when

25 synthesising fully modified LNA oligonucleotides or when incorporating LNAs in otherwise unmodified DNA or RNA stands or LNAs into an all-phosphorothioate oligonucleotide. LNA oligonucleotides were dissolved in pure water and the concentration determined as OD<sub>260</sub>. Solubilities in all cases were excellent. For plain DNA/RNA synthesis and partially modified LNA oligomers, a standard CPG support or

30 a polystyrene support, was used. For the synthesis of fully modified LNA oligomers (e.g. 5'-d(GTGATATGC)-3'), a BioGenex Universal CPG Support (BioGenex, U.S.A.) was used, or LNA derivatised supports were used.)

**Example 125**

- Synthesis of phosphorothioate LNA oligonucleotides.** The all-phosphorothioate LNA (Table 7) was synthesised on an automated DNA synthesiser using similar conditions as those described earlier (Example 124). Beaucages' reagent was used as 5 sulphurising agent. The stepwise coupling yields were >98%. After completion of the syntheses, deprotection and cleavage from the solid support was effected using concentrated ammonia (55 °C, 14 h).

**Example 126**

- 10 **Synthesis of 2'-Thio-LNA oligonucleotides.** The 2'-thio-LNA oligonucleotides (containing monomer U<sup>s</sup> (formula Z (thio-variant) of Figure 2), Figure 37, Table 8) were synthesised on an automated DNA synthesiser using standard conditions (Example 124). The step-wise coupling yield for amidite 76F was approximately 85% (12 min couplings; improved purity of amidite 76F is expected to result in increased coupling 15 yield). After completion of the syntheses, deprotection and cleavage from the solid support was effected using concentrated ammonia (55 °C, 8 h).

**Example 127**

- 20 **Synthesis of 2'-Amino-LNA oligonucleotides.** By procedures similar to those described in Example 126, 2'-Amino-LNA oligonucleotides (containing monomer T<sup>NH</sup> and monomer T<sup>NM</sup> (formula Z (amino variants) of Figure 2), Figures 35 and 36) was efficiently obtained on an automated DNA synthesiser using amidites 74A and 74F (≥98% stepwise coupling yields).

**25 Example 128**

- Fluorescein-labeling of LNA oligomers.** LNA oligomers (formula Z of Figure 2) AL16 (5'-d(TGTGTGAAATTGTTAT)-3'; LNA nucleotides in bold) and AL17 (5'-d(ATAAAGTGTAAAG)-3'; LNA nucleotides in bold) were successfully labeled with fluorescein using the FluoroAmp T4 Kinase Green Oligonucleotide Labeling System as 30 described by the manufacturer (Promega). Briefly, 16 nmol of either LNA-oligomer AL16 or AL17 was 5'-thiophosphate labelled in a 50 µl reaction buffer containing T4 kinase and γ-S-ATP. The reactions were incubated for 2 h at 37 °C. The thiophosphorylated LNA oligos were precipitated by the addition of 5µl of oligonucleotide precipitant (Promega) and 165 µl of ice cold (-20 °C) 95 % ethanol. After

- centrifugation the pellets were washed once with 500  $\mu$ l of ice cold (-20°C) 70% ethanol and redissolved in 25  $\mu$ l of PBSE buffer. Freshly prepared 5-maleimide-fluorescein solution (50  $\mu$ g in 5  $\mu$ l DMSO) were added to the thiophosphorylated LNA oligos and the reaction mixtures incubated at 68° C for 30 min. Additional 5-maleimide-fluorescein (50  $\mu$ g in 5  $\mu$ l DMSO) were added to each LNA oligo and the reaction mixtures incubated for an additional 60 min. After incubation 10  $\mu$ l of oligonucleotide precipitant was added to each reaction mixture followed by 180  $\mu$ l ice-cold (-20° C) and 100/ $\mu$ l N,N-dimethylformamide. The fluorescein labeled LNA oligos were isolated by centrifugation followed by aspiration of the supernatant. The 10 fluorescein labelled LNA-oligomers were purified by reversed-phase HPLC as follows: column Delta-Pack C-18, 300A, 0.4 x 30 cm; eluent 0-50 % acetonitrile in 0.04 M triethylammonium buffer (pH 7.0); flow rate 1.5 ml/min. The fractions containing LNA-oligos were pooled and evaporated under reduced pressure (oil pump and speed-vac system) during 12 h.

#### Hybridisation data

##### Example 129

- Thermostability of oligonucleotides containing monomers of formula V, X, Y and Z<sup>T</sup>, Z<sup>U</sup>, Z<sup>G</sup>, Z<sup>C</sup>, Z<sup>A</sup>, Z<sup>Moc</sup>. The thermostability of the LNA modified oligonucleotides were determined spectrophotometrically using a spectrophotometer equipped with a thermoregulated Peltier element. Hybridisation mixtures of 1 ml were prepared containing either of 3 different buffers (10mM Na<sub>2</sub>HPO<sub>4</sub>, pH 7.0, 100mM NaCl, 0.1mM EDTA; 10mM Na<sub>2</sub>HPO<sub>4</sub> pH 7.0, 0.1mM EDTA; 3M tetramethylammoniumchlorid (TMAC), 10mM Na<sub>2</sub>HPO<sub>4</sub>, pH 7.0, 0.1mM EDTA) and equimolar (1  $\mu$ M or 1.5  $\mu$ M) amounts of the different LNA modified oligonucleotides and their complementary or mismatched DNA or RNA oligonucleotides. Identical hybridisation mixtures using the unmodified oligonucleotides were prepared as references. The T<sub>m</sub>'s were obtained as the first derivative of the melting curves. Tables 1-4 summarise the results (LNAs are marked with bold). Figure 2 illustrates the monomeric LNAs used. The nomenclature V, X, Y and Z<sup>T</sup>, Z<sup>U</sup>, Z<sup>G</sup>, Z<sup>C</sup>, Z<sup>A</sup>, Z<sup>Moc</sup> refer to structures V, X, Y and Z of Figure 2. In the tables, the nucleobases of the LNA monomers are indicated. Furthermore, for the thio and amino variants of the LNA structure Z of the last two tables, the nomenclature used is, e.g., Z<sup>TS</sup> and Z<sup>TNH</sup>, respectively.

LNAs containing structure Z were particularly thoroughly examined (see Table 1). When three Z<sup>T</sup> residues were incorporated into an oligonucleotide of mixed sequence the T<sub>m</sub>'s obtained in NaCl buffer with both complementary DNA (10) and RNA (16) 5 oligonucleotides were substantially higher (RNA: roughly 7 °C and DNA: roughly 5 °C per modification) than the T<sub>m</sub> of the corresponding duplexes with unmodified oligonucleotides (1 and 8). Similar results were obtained with LNAs containing two Z<sup>T</sup> residues and either one Z<sup>G</sup> (21 and 24B) or Z<sup>U</sup> (25), Z<sup>C</sup> (69), Z<sup>Moc</sup> (65), and Z<sup>A</sup> (58) residues. When mismatches were introduced into the target RNA or DNA 10 oligonucleotides the T<sub>m</sub> of the LNA modified oligonucleotides in all cases dropped significantly (11-15A and 17; 18-20 and 22-24A; 26-31; 57 and 59-60; 63-64 and 66, and 67), unambiguously demonstrating that the LNA modified oligonucleotides hybridise to their target sequences obeying the Watson-Crick hydrogen bonding rules. In all cases the drop in T<sub>m</sub> of the LNA modified oligonucleotides upon introduction of 15 mismatches was equal to or greater than that of the corresponding unmodified oligonucleotides (2-7 and 9; 33-38), showing that the LNA modified oligonucleotide are at least as specific as their natural counterparts. A lowering of the ionic strength of the hybridisation buffer (from 10mM Na<sub>2</sub>HPO<sub>4</sub>, pH 7.0, 100mM NaCl, 0.1mM EDTA to 10mM Na<sub>2</sub>HPO<sub>4</sub> pH 7.0, 0.1mM EDTA) lowers the T<sub>m</sub> of the LNA modified 20 oligonucleotides for their complementary DNA oligos (40,41) or RNA oligonucleotides (40A, 41A). A similar effect is observed with the unmodified oligonucleotides and its complementary DNA oligo (39) or RNA oligo (39A).

Addition of 3M tetramethylammoniumchlorid (TMAC) to the hybridisation buffer 25 significantly increases the T<sub>m</sub> of the LNA modified oligonucleotide for their complementary DNA oligos (10,21,25). Moreover, TMAC levels out the differences in the T<sub>m</sub>'s of the different oligonucleotides which is observed in the NaCl buffer (lowest T<sub>m</sub> in the NaCl buffer 44°C and highest 49°C as opposed to 56°C and 57°C in TMAC). Introduction of mismatches substantially decreases the T<sub>m</sub> of the LNA modified 30 oligonucleotides for their DNA targets (11-13, 18-20, and 26-28). A similar picture emerges with the unmodified reference oligonucleotides (1-4 and 32-35)

The data with the low salt buffer shows that LNA modified oligonucleotides exhibit a sensitivity to the ionic strength of the hybridisation buffer similar to normal

oligonucleotides. From the  $T_m$  data with the TMAC buffer we infer that TMAC exhibits a  $T_m$  equalising effect on LNA modified oligonucleotides similar to the effect observed with normal DNA oligonucleotides. LNA modified oligonucleotides retain their exquisite specificity in both hybridisation buffers.

5

- The fully modified LNA oligonucleotide containing all four monomers (71 and 75), the almost fully modified LNA oligonucleotide (except for a 3'-terminal DNA nucleoside) containing both Z<sup>G</sup> and Z<sup>T</sup> (41 and 41A) and the partly modified oligonucleotide containing a central block of Z<sup>T</sup> and Z<sup>G</sup> (40 and 40A) also exhibit substantially increased affinity compared to the unmodified control oligonucleotide (39 and 39A; 1 and 8). This shows that LNAs of formula Z are very useful in the production of both fully and partly modified oligomers. We note that the almost fully modified oligomer (41 and 41A) exhibits an unprecedented high affinity for both complementary RNA (>93°C) and DNA (83°C). A similar extreme affinity (for both RNA and DNA) was observed with the almost fully modified LNA oligomer containing exclusively Z<sup>T</sup> (Table 1: 52 and 53) and the fully modified LNA oligomer (71 and 75). The affinity of the partly modified poly-T oligonucleotide depended on the positions and the number of Z<sup>T</sup> monomers incorporated (44-51). Whereas the  $T_m$ 's with RNA targets (45, 47, 49 and 51) in all cases were higher than the corresponding unmodified oligonucleotides (43) one gave a lower  $T_m$  with the DNA target (46). Since mixed sequence oligonucleotide containing 3 Z<sup>T</sup> residues exhibited a substantially increased affinity for their DNA (10) and RNA target (16) compared to the unmodified reference oligonucleotides (1 and 8) this suggests that other binding motifs than Watson-Crick (such as for example the Hoogsteen binding motif) are open to poly-T oligonucleotides and that these binding motifs are somewhat sensitive to the precise architecture of the modified oligonucleotide. In all cases introduction of single base mismatches into the complex between the fully Z<sup>T</sup> modified poly-T oligonucleotide and a DNA target (54-56) resulted in a significant drop in  $T_m$ .
- 30 Oligonucleotides containing either LNAs of structures V (Table 2), X (Table 3) and Y (Table 4) were analysed in the context of fully and partly modified poly-T sequences. The fully modified oligonucleotides of structure V and Y exhibited an increase in  $T_m$  (albeit much lower than the Z<sup>T</sup> modified oligonucleotides) with both RNA (Table 2, 14 and Table 4, 14) and DNA targets (Table 2, 13, and Table 4, 13) compared to the

unmodified oligonucleotides (Table 1, 42 and 43). The partly modified oligonucleotides containing monomers of structure V and Y behaved similarly to partly modified oligonucleotides containing Z<sup>T</sup> and probably this is due to the homopolymer nature of the sequence as outlined above. Oligonucleotides containing X<sup>T</sup> in all cases exhibited a  
5 much reduced T<sub>m</sub> compared to the reference DNA oligonucleotides.

#### Example 130

A fully modified LNA oligonucleotide form stable hybrids with complementary DNA in both the anti-parallel and the parallel orientation. A full modified LNA oligonucleotide  
10 was hybridised to its complementary DNA in both the anti-parallel and the parallel orientation. Hybridisation solutions (1 mL) contained 10 mM Na<sub>2</sub>HPO<sub>4</sub> (pH 7), 100 mM NaCl and 0.1 mM EDTA and 1 µM of each of the two oligonucleotides. As shown in Table 1 both the anti-parallel (71) and the parallel binding orientation (77) produces stable duplexes. The anti-parallel is clearly the most stable of the two. However, even  
15 the parallel duplex is significantly more stable than the corresponding anti-parallel duplex of the unmodified DNA oligonucleotides (Table 1, 1).

#### Example 131

LNA monomers can be used to increase the affinity of RNA oligomers for their  
20 complementary nucleic acids. The thermostability of complexes between a 9-mer RNA oligonucleotide containing 3 LNA-T monomers (Z<sup>T</sup>) and the complementary DNA or RNA oligonucleotides were measured spectrophotometrically. Hybridisation solutions (1 ml) containing 10mM Na<sub>2</sub>HPO<sub>4</sub>, pH 7.0, 100mM NaCl, 0.1mM EDTA and 1µM of each of the two oligonucleotides. Identical hybridisation mixtures using the unmodified  
25 RNA oligonucleotides were measured as references. As shown in Table 5 the LNA modified RNA oligonucleotide hybridises to both its complementary DNA (1) and RNA (3) oligonucleotide. As previously observed for LNA modified DNA oligonucleotides, the binding affinity of the LNA modified RNA oligonucleotide is strongest to the RNA complement (3). In both cases the affinity of the LNA modified RNA oligonucleotide is  
30 substantially higher than that of the unmodified controls (2 and 4). Table 5 also shows that the specificity towards both DNA and RNA targets are retained in LNA modified RNA oligonucleotides.

**Example 132**

LNA-LNA base pairing. RNA or DNA oligonucleotides containing three Z<sup>T</sup> LNA monomers or an oligonucleotide composed entirely of LNA Z monomers were hybridised to complementary unmodified DNA oligonucleotides or DNA oligo-  
5 nucleotides containing three Z<sup>A</sup> LNA monomers and the T<sub>m</sub> of the hybrids were measured spectrophotometrically. Hybridisation solutions (1 ml) contained 10mM Na<sub>2</sub>HPO<sub>4</sub>, pH 7.0, 100mM NaCl and 0.1mM EDTA and 1 µM of each of the two oligonucleotides. As shown in Table 6 all the LNA modified oligonucleotides hybridises to the complementary, unmodified DNA oligonucleotides (2 and 3) as well as the  
10 complementary LNA modified oligonucleotides (4, 5 and 6). As observed previously the presence of LNA monomers in one strand of a hybrid (2 and 3) increases the T<sub>m</sub> significantly compared to the unmodified control hybrid (1). The presence of LNA-LNA base pairs in the hybrid increases the T<sub>m</sub> even further (4 and 5) Moreover, a highly stable hybrid can be formed between a fully modified LNA oligonucleotide and a partly  
15 LNA-Z<sup>A</sup> modified DNA oligonucleotide (6). This constitutes the first example of LNA-  
LNA base pairs in a hybrid.

**Example 133**

An LNA all-phosphoromonothioate oligonucleotide display relatively less decreased  
20 thermostability towards complementary DNA and RNA than the corresponding all-  
phosphorothioate DNA oligonucleotide. The thermostability of an all-  
phosphoromonothioate DNA oligonucleotide containing three Z<sup>T</sup> LNA monomers (LNA  
oligonucleotide) and the corresponding all-phosphoromonothioate reference DNA  
oligonucleotide towards complementary DNA and RNA was evaluated under the same  
25 conditions as described in Example 132, however without EDTA (Table 7). It was  
observed that the LNA all-phosphoromonothioate oligonucleotide containing three LNA  
Z<sup>T</sup> monomers displayed only weakly decreased thermostability (Table 7, 3 and 4)  
when compared to the corresponding reference LNA oligonucleotide (Table 1, 10 and  
16). The corresponding all-phosphoromonothioate DNA oligonucleotide (Table 7, 1 and  
30 2) displayed significantly decreased thermostability when compared to the  
corresponding reference DNA oligonucleotide (Table 1, 1 and 8). This has important  
possible implications on the use of all- or partially phosphoromonothioate LNA  
oligonucleotides in antisense and other therapeutic applications. Thus, the  
compatibility of LNA monomers and unmodified monomers in an phosphoromono-

thioate oligonucleotide has been demonstrated. It can be anticipated that such constructs will display both RNase H activity and nuclease resistance in addition to the LNA enhanced hybridisation characteristics.

5 Example 134

2'-Thio-LNA display nucleic acid recognition properties comparable with those of LNA (Monomer Z). The hybridisation conditions were as described in Example 132, however without EDTA. The results for the 2'-thio-LNAs (Table 8) clearly indicate a positive effect on the thermal stability of duplexes towards both DNA and RNA by the introduction of 2'-thio-LNA monomer U<sup>s</sup> (The monomers correspond to formula Z of Figure 2 where the methyleneoxy bridge has been substituted with a methylenethio bridge). This effect ( $\Delta T_m \sim +5$  °C / modification towards DNA;  $\Delta T_m \sim +8$  °C / modification towards RNA) is comparable with that observed for parent LNA. The picture is complicated by the simultaneous introduction of two modifications (the 2'-thio functionality and uracil instead of thymine). However, as we have earlier observed identical melting temperatures for the LNA thymine and uracil monomers, and as the references containing 2'-deoxyuridine instead of thymidine, if anything, would be expected to display lower  $T_m$  values, the comparison is relevant.

20 Example 135

2'-Amino-LNA (Monomer Z<sup>NH<sub>2</sub></sup>) and 2'-Methylamino-LNA (Monomer Z<sup>NMe<sub>2</sub></sup>) display nucleic acid recognition properties comparable with those of parent LNA (Monomer Z). The hybridisation conditions were as described in Example 132, however without EDTA. The melting results for the 2'-amino-LNAs (Table 9) clearly indicate a positive effect on the thermal stability of duplexes towards DNA and RNA by introduction of either 2'-amino-LNA monomers T<sup>NH<sub>2</sub></sup> or T<sup>NMe<sub>2</sub></sup> (The monomers correspond to formula Z of Figure 2 where the methyleneoxy bridge has been substituted with a methyleneamino bridge or methylene-(N-methyl)amino bridge, respectively). This effect ( $\Delta T_m \sim +3$  °C / modification towards DNA and  $\Delta T_m \sim +6$  to  $+8$  °C / modification towards RNA) is comparable to that of parent LNA. It is noteworthy, that the increased thermal affinity is also observed with an oligo composed of a mixture of 2'-alkylamino-LNA monomers and nonalkylated 2'-amino-LNA monomers.

**LNA and LNA modified oligonucleotides as a substrates for enzymes****Example 136**

3'-Exonuclease stability of oligomers 5'-V<sup>T</sup><sub>13</sub>T and 5'-Z<sup>T</sup><sub>13</sub>T. A solution of 5 oligonucleotides (0.2 OD) in 2 ml of the following buffer (0.1 M Tris-HCl, pH 8.6, 0.1 M NaCl, 14 mM MgCl<sub>2</sub>) was digested at 25°C with 1.2 U SVPDE (snake venom phosphodiesterase). During digestion, the increase in absorbance at 260 nm was followed. Whereas the unmodified control T<sub>14</sub> was fully degraded after 10 min of degradation, 5-Z<sup>T</sup><sub>13</sub>T and 5'-V<sup>T</sup><sub>13</sub>T remained intact for 60 min.

10

**Example 137**

LNA modified oligos as substrates for T4 polynucleotide kinase. 20 pmoles of each primer (FP2: 5'-GGTGGTTTGTGTTG-3'; DNA probe), (AL2: 5'-GGTGGTTTGTGTTG-3', LNA nucleosides in bold) and (AL3: 5'-GGTGGTTTGTGTTG-3', LNA nucleosides in bold) was mixed with T4 polynucleotide Kinase (5 Units; New England Biolabs) and 6  $\mu$ l  $\gamma$ -<sup>32</sup>PATP (3000 Ci/mmol, Amersham) in a buffer containing 70 mM Tris-HCl (pH 7.6), 10 mM MgCl<sub>2</sub>, 5 mM dithiotretiol (final volume 20  $\mu$ l). The samples were incubated 40 min at 37°C and afterwards heated to 65°C for 5 min. To each of the reactions were added 2  $\mu$ l of tRNA (1  $\mu$ g/ $\mu$ l), 29  $\mu$ l of a 3M ammonium acetate and 20 100  $\mu$ l of ethanol. The reactions were incubated at -20°C for 30 min. and the labelled oligos were precipitated by centrifugation at 15000g for 30 min. The pellet was resuspended in 20  $\mu$ l H<sub>2</sub>O. The samples (1  $\mu$ l) were mixed with a loading buffer (formamide (pH 8.0), 0.1 % xylene cyanol FF, 0.1 % bromophenol blue and 10 mM EDTA) and electrophoresed on a denaturing polyacrylamide gel (16 % acrylamide/-bisacrylamide solution, 7 M urea, 1 X TBE and 0.1 mM EDTA) in a TBE running buffer (90 mM Tris-HCl (pH 8.3), 90 mM boric acid and 2.5 mM disodium EDTA-2 H<sub>2</sub>O). The gel was dried on a gel dryer (BioRad model 583) and autoradiographed to a X-ray film (CL-Xposure film, Pierce 34075) for 20 min. The result is shown in Figure 6 (FP2: lane 1 and 2; AL2: lane 3 and 4; AL3: lane 5 and 6). Three conclusions can be drawn on 25 the basis of this experiment. Firstly, it can be concluded that partly and fully LNA modified oligos are excellent mimics of natural nucleic acid in their ability to act as substrate for a nucleic acid specific enzyme like polynucleotide kinase. Secondly, it can be concluded that LNA modified oligos can be efficiently precipitated by 30 procedures normally employed to precipitate standard nucleic acids. In fact, the

relative signal intensities of the unmodified (lane 1,2), partly (lane 3,4) and fully modified oligos (lane 5,6) in the autoradiogram suggests that the more LNA nucleosides a standard DNA oligo contains the more efficiently it can be precipitated by salt/alcohol procedures. Thirdly, the similar positions of the signal in the 5 autoradiogram of the unmodified, partly and fully modified oligos shows that incorporation of LNA nucleosides into a DNA oligo does not alter its electrophoretic mobility in polyacrylamide gels.

#### Example 138

10 **3'-End labelling of LNA-containing oligonucleotides with terminal deoxynucleotidyl transferase.** Oligonucleotides containing LNA monomers were 3'end-labelled using the enzyme terminal deoxynucleotidyl transferase. The sequence and extent of LNA modification were as follows (where LNA monomers are in bold):

Control      5' GGT GGT TTG TTT G 3'

15 (1)      5' GGT GGT TTG TTT G 3'

(2)      5' GGT GGT TTG TTT G 3'

(3)      5' **GGT GGT TTG TTT G** 3'

Oligonucleotide (50 pmol) was incubated with 250  $\mu$ Ci [ $\alpha$ -<sup>32</sup>P]ddATP (3000 Ci/mmol)

20 and 100 Units terminal deoxynucleotidyl transferase in 250  $\mu$ l 100mM cacodylate buffer pH 7.2, 2mM CoCl<sub>2</sub> and 0.2mM 2-mercaptoethanol at 37°C for 2 hours. The reaction was then stopped by adding formamide loading buffer and heating to 100°C for 5 min before placing on ice. Samples (0.2 pmol) were run on a 19% acrylamide gel containing 7M urea and the percentage incorporation of radioactivity into the 25 oligonucleotide bands was quantified by means of a phosphorimager (Molecular Dynamics). The results show incorporation of radioactivity in all cases, including the oligonucleotide with a high LNA content: Control 94.9%, (1) 39.7%, (2) 83.7%, (3) 31.7%. We conclude that LNA modified oligos are substrates for the TdT enzyme.

30 **Example 139**

**The ability of terminal deoxynucleotidyl transferase (TdT) to tail LNA modified oligonucleotides depends on the design of the oligomer.** The following 15mer primers and a mixture of 8 to 32 base oligonucleotide markers were 5' end labelled with [ $\gamma$  <sup>33</sup>P] ATP and T4 polynucleotide kinase (where LNA monomers are in bold):

P1 5'-TGC ATG TGC TGG AGA-3'  
P2 5'- GC ATG TGC TGG AGA T-3'  
PZ1 5'-TGC ATG TGC TGG AGA-3'  
PZ2 5'- GC ATG TGC TGG AGA T-3'

5 Reactions were boiled for 5 min after labelling to remove any PNK activity. Four picomoles of each labelled primer, 25 U terminal deoxynucleotidyl transferase and 16  $\mu$ M dATP were incubated in 25  $\mu$ l 100 mM cacodylate buffer pH 7.2, 2 mM CoCl<sub>2</sub> and 0.2 mM 2-mercaptoethanol for 90 min at 37°C. The reactions were stopped by the addition of formamide stop solution and the reaction products run on a 19% polyacrylamide 7 M urea gel with the labelled markers. Autoradiography using Biomax film was carried out on the dry gel. As shown in Figure 22, P1 (lane 2), P2 (lane 4) and PZ1 (lane 3) all gave a tail estimated at greater than 70 bases long on the basis of the 8-32 base marker (lanes 1 and 6). Primer PZ2 (lane 5) was not extended under these reaction conditions. We conclude that the TdT enzyme will tolerate LNA monomers 10 within the oligonucleotide, but not at the extreme 3' end.

15

#### Example 140

**LNA-thymidine-5'-triphosphate (LNA-TTP) as a substrate for terminal deoxynucleotidyl transferase (TdT).** In order to test the ability of the triphosphate of LNA-TTP (Example 20 123) to be accepted by terminal deoxynucleotidyl transferase as a substrate, an oligonucleotide tailing reaction was performed. A 15mer primer (sequence: 5'-TGC 25 ATG TGC TGG AGA-3') and a mixture of 8 to 32 base oligonucleotide markers were 5' end labelled with [ $\gamma$  <sup>33</sup>P] ATP and T4 polynucleotide kinase. Reactions were boiled for 5 min after labelling to remove any PNK activity. Four picomoles of the labelled 30 primer, 25 U terminal deoxynucleotidyl transferase and 32, 64 or 128  $\mu$ M dTTP or LNA-TTP were incubated in 25  $\mu$ l 100 mM cacodylate buffer pH 7.2, 2 mM CoCl<sub>2</sub> and 0.2 mM 2-mercaptoethanol for 90 min at 37°C. The reactions were stopped by the addition of formamide stop solution and the reaction products run on a 19% polyacrylamide 7M urea gel with the labelled markers. Autoradiography using Biomax 35 film was carried out on the dry gel. As shown in Figure 10, reactions with either 32  $\mu$ M dTTP (lane B), 64  $\mu$ M dTTP (lane C) or 128  $\mu$ M dTTP (lane D) all produced tailed oligonucleotides which on the basis on the 8-32 oligonucleotide marker (outermost left and right lanes) were estimated at greater than 100 nucleotides. The LNA-TTP reactions (32  $\mu$ M dTTP (lane E), 64  $\mu$ M dTTP (lane F) or 128  $\mu$ M dTTP (lane G)) all

resulted in the primer being extended by one base and ~50% of this being extended by a further base. This result is very similar to that obtained with ribonucleotides and TdT. We conclude that LNA derived triphosphates can be recognised and incorporated into a DNA oligonucleotide by the TdT enzyme. This latter finding that LNA-TTP can bind to the polymerase underscores the possibility of successfully using LNA-monomer derivatives as nucleoside drugs.

#### Example 141

Exonuclease free Klenow fragment DNA polymerase I can incorporate LNA Adenosine, 10 Cytosine, Guanosine and Uridine-5'-triphosphates (LNA ATP, LNA CTP, LNA GTP, LNA UTP) into a DNA strand. A primer extension assay was used to evaluate the LNA NTP's (see Example 123), ribonucleotides, as substrates for exonuclease free Klenow fragment DNA polymerase I (EFK). The assay used a  $^{33}\text{P}$  5' end labelled 15mer primer hybridised to one of four different 24mer templates. The sequences of the primer and 15 templates are (LNA monomer in bold):

Primer	5' TGCATGTGCTGGAGA 3'
Template 1	3' ACGTACACGACCT <b>CT</b> ACCTTGCTA 5'
Template 2	3' ACGTACACGACCT <b>CT</b> CTTGATCAG 5'
Template 3	3' ACGTACACGACCT <b>CT</b> GGCTAGTC 5'
Template 4	3' ACGTACACGAC <b>CT</b> TGA <b>CT</b> AGTC 5'

One picomole  $^{33}\text{P}$  labelled primer was hybridised to 2 picomoles of template in x2 Klenow buffer. To this was added either 4  $\mu\text{M}$  dNTP $\alpha$ S or 500  $\mu\text{M}$  LNA NTP or a mixture of 4  $\mu\text{M}$  dNTP $\alpha$ S and 500  $\mu\text{M}$  LNA NTP. Two units of EFK DNA polymerase was added to each reaction. 2mU inorganic pyrophosphatase was added to each of 25 the reactions. Primer plus template plus enzyme controls were also carried out. All reactions were carried out in a total volume of 20  $\mu\text{l}$ . The reactions were incubated at 37°C for 3 min. Reactions were then stopped by the addition of 10  $\mu\text{l}$  formamide EDTA stop solution. Reaction products were separated on a 19% polyacrylamide 7M urea gel and the product fragments sized by comparison with a  $^{33}\text{P}$  labelled 8 to 32 30 base oligonucleotide ladder after exposure to Kodak Biomax autoradiography film.

Figure 20 shows the result with LNA-UTP using template 1. The tracks (1-12) correspond to the following reactions: Incorporation of LNA UTP by EFK. Lane 1 - Primer, template and enzyme. Lane 2 - plus dTTP $\alpha$ S. Lane 3 - plus LNA UTP. Lane 4 -

plus dTTP $\alpha$ S and dGTP $\alpha$ S. Lane 5 - plus LNA UTP and dGTP $\alpha$ S. Lane 6 - plus dATP $\alpha$ S, dGTP $\alpha$ S and dTTP $\alpha$ S. Lane 7 - plus LNA UTP, dCTP $\alpha$ S, dGTP $\alpha$ S and dTTP $\alpha$ S. Lane 8 - plus dGTP $\alpha$ S. Lane 9 - plus dCTP $\alpha$ S, dGTP $\alpha$ S and dTTP $\alpha$ S. Lane 10 - plus LNA UTP, dATP $\alpha$ S, dCTP $\alpha$ S and dGTP $\alpha$ S. Lane 11 - plus dATP $\alpha$ S, dCTP $\alpha$ S and dGTP $\alpha$ S. Lane 12 - all 4 dNTP $\alpha$ S. The lanes either side show the 8 - 32 base oligonucleotide markers used for sizing the products.

As is evident from Figure 20, LNA UTP is specifically incorporated as a "T". Further extension from an LNA UTP terminated 3' end with dNTP $\alpha$ S is very slow.

10

Figure 21 shows the result with LNA-ATP, LNA CTP, and LNA GTP using template 2-4. The tracks (1-21) correspond to the following reactions: Lanes 1, 7, 13 and 17 - primer, template and enzyme. Lane 2 - plus dGTP $\alpha$ S. Lane 3 - plus dATP $\alpha$ S and dGTP $\alpha$ S. Lane 4 - plus LNA GTP. Lane 5 - plus dGTP $\alpha$ S and LNA ATP. Lane 6 - plus LNA ATP and LNA GTP. Lane 8 - plus dATP $\alpha$ S. Lane 9 - plus dATP $\alpha$ S and dCTP $\alpha$ S. Lane 10 - plus LNA ATP. Lane 11 - plus dCTP $\alpha$ S and LNA ATP. Lane 12 - plus dATP $\alpha$ S and LNA CTP. Lane 14 - plus dTTP $\alpha$ S. Lane 15 - plus dGTP $\alpha$ S and dTTP $\alpha$ S. Lane 16 - plus dTTP $\alpha$ S and LNA GTP. Lane 18 - plus dCTP $\alpha$ S. Lane 19 - plus dCTP $\alpha$ S and dTTP $\alpha$ S. Lane 20 - plus LNA CTP. Lane 21 - dTTP $\alpha$ S and LNA CTP. The lanes either side show the 8 - 32 base oligonucleotide markers used for sizing the products.

The experiments using template 2 (track 1-6), show that LNA GTP is able to produce the +1 product with efficient extension of the primer (track 4). The addition of dGTP $\alpha$ S and LNA ATP results in mainly the +2 product (track 5). This is from the incorporation of dGTP $\alpha$ S to give the +1 product followed by extension with LNA ATP. There is evidence of a small amount of +3 product from the consecutive incorporation of LNA ATP. The experiments using Template 3 (tracks 7-12) show that LNA ATP is efficiently incorporated to give the +1 product (track 10). Extension of this product with dCTP $\alpha$ S is slow (track 11). The addition of dATP $\alpha$ S and LNA CTP results in the +2 and +3 products (track 12). The absence of any significant +1 product shows that the addition of the first LNA CTP is efficient, but that the addition of the second LNA CTP is slow. The results from experiments on Templates 1 (tracks 13-16) and 4 (tracks 17-21) show similar trends to those on the other templates. LNA

CTP is efficiently incorporated to give the + 1 product on Template 4 (track 20). Extension of this product by dTTP $\alpha$ S is again slow (track 21). The addition of LNA GTP and dTTP $\alpha$ S to reactions on Template 1 results in the + 2 product (track 16). Again this shows that the addition of a single LNA triphosphate is quite efficient, but 5 that the addition of consecutive LNA triphosphates is slow.

#### Example 142

LNA monomers can be used to enhance the resistance of an oligonucleotide to digestion by exonuclease III. In order to test the resistance of the LNA containing 10 oligonucleotides to Exonuclease III degradation the following reaction was performed. The following 15mer primers and 8 to 32 base oligonucleotide markers were 5' end labelled with [ $\gamma$   $^{32}$ P] ATP and T4 polynucleotide kinase (LNA monomer in bold):

P2     5'- GC ATG TGC TGG AGA T-3'  
PZ2    5'- GC ATG TGC TGG AGA T-3'

15 Reactions were boiled for 5 min after labelling to remove any PNK activity. 8 picomoles of each primer was hybridised to 25 pmoles Template (sequence: 3'- ACG TAC ACG ACC TCT ACC TTG CTA-5') in x2 Klenow buffer. 10 Units of Exonuclease III was added to each of the reactions. Controls were also set up which had 1  $\mu$ l water 20 added in place of the enzyme. The reactions were incubated at 37°C for 5 min. The reactions were stopped by the addition of 10  $\mu$ l formamide/EDTA stop solution. The reactions were heated at 95°C for 3 min before loading onto a 19% polyacrylamide 7M urea gel. The gel was fixed in 10% acetic acid/10% methanol before transferring to 3MM paper and drying. The dried gel was exposed to a phosphor screen for 3 25 hours. The phosphor screen was analysed on the Molecular Dynamics Storm 860 instrument using ImageQuant software. The phosphor screen analysis showed that in the absence of the enzyme the P2 full length band was 99% of the signal and PZ2 full length band was 96% of the signal. In the presence of the enzyme only 20% of the P2 full length product was left after the 5 minute incubation. However, 62% of the 30 full length PZ2 product remained after the same treatment. This shows that a single LNA monomer at the 3' end of an oligonucleotide can enhance the resistance to degradation by exonuclease III.

**PCR applications****Example 143**

LNA monomers can be used to significantly increase the performance of biotinylated-

- 5 DNA oligos in the sequence specific capture of PCR amplicons in a MTP format. Two DIG labelled amplicons from pUC19 were generated by PCR amplification as follows:

**PCR reaction mixture for Amplicon 1**

30

10  $\mu$ l from each PCR reaction was analysed on a standard agarose gel and the expected fragments of approximately 100 bp and 500 bp were observed.

10  $\mu$ l of DIG-labelled amplicon 1 or amplicon 2 was mixed with 5 pmol of 5' biotinylated capture probe in 1xSSC (0.15 M NaCl, 15mM citrate, pH 7.0) in a total volume of 450  $\mu$ l. The following capture probes were used: B-DNA1 (biotin-ATGCCTGCAGGTCGAC-3'; DNA probe specific for amplicon 1), B-DNA2 (biotin-5 GGTGGTTTGT<sup>b</sup>TG-3'; DNA probe specific for amplicon 2) and B-LNA2 (biotin-GGTGGTTTGT<sup>b</sup>TG-3', LNA nucleosides in bold; LNA probe specific for amplicon 2). Reactions were heated to 95°C for 5 min in order to denature amplicons and allowed to cool at 25°C for 15 min to facilitate hybridisation between the probe and the target amplicon strand. After hybridisation 190  $\mu$ l of each reaction were transferred to a 10 streptavidin coated micro plate (Pierce, cat. no.15124) and incubated for one hour at 37°C. After washing the plate with phosphate buffered saline (PBST, 0.15 M Na<sup>+</sup>, pH 7.2, 0.05% Tween 20, 3x 300 $\mu$ l), 200  $\mu$ l of peroxidase labelled anti- DIG antibodies were added (Boehringer Mannheim, diluted 1:1000 in PBST). Plates were incubated for 30 min at 37°C and washed (PBST, 3x 300 $\mu$ l). Wells were assayed for peroxidase 15 activity by adding 100  $\mu$ l of substrate solution (0.1 M citrate-phosphate buffer pH 5.0, 0.66mg/ml ortho-pheylenediamine dihydrochloride, 0.012% H<sub>2</sub>O<sub>2</sub>). The reaction was stopped after 8 min by adding 100  $\mu$ l H<sub>2</sub>SO<sub>4</sub> (0.5 M) and the absorbance at 492 nm was read in a micro plate reader. As shown in Figure 3, the unmodified bio-DNAs capture probes (B-DNA1 and B-DNA2) both behave as expected, *i.e.* they each 20 capture only their target PCR amplicon. Compared to the B-DNA1 probe the B-DNA2 probe is rather inefficient in capturing its cognate amplicon. The capture efficiency of the B-DNA2 probe, however, can be dramatically improved by substituting 12 of its 13 DNA nucleosides by the corresponding LNA nucleosides. As shown in Figure 3 the use of the B-LNA2 probe in place of the B-DNA2 probe leads to a more than 10 fold 25 increase in the sensitivity of the assay. At the same time the B-LNA2 retains the ability of the un-modified B-DNA2 to efficiently discriminate between the related and non-related amplicon, underscoring the excellent specificity of LNA-oligos. We conclude that 1) biotin covalently attached to an LNA modified oligo retains its ability to bind to streptavidin, 2) that LNA modified oligos works efficiently in a MTP based 30 amplicon capture assay and that 3) LNA offers a means to dramatically improve the performance of standard DNA oligos in the affinity capture of PCR amplicons.

**Example 144**

An LNA substituted oligo is able to capture its cognate PCR amplicon by strand invasion. Two identical sets of 10 $\mu$ l reactions of amplicon1 or 2 (prepared as in Example 143) were mixed with either 1, 5 or 25pmol of the B-LNA2 capture probe 5 (biotin-**GGTGGTTTGTTG-3'**, LNA nucleosides in bold; probe specific for amplicon 2) in 1 x SSC (0.15 M NaCl, 15mM citrate, pH 7.0) in a total volume of 450  $\mu$ l. One set of reactions were heated to 95 °C for 5 min in order to denature amplicons and allowed to cool to 25 °C to facilitate hybridisation between the probe and the target amplicon strand. The other set of reactions were left without denaturation. From each 10 of the reactions 190  $\mu$ l were transferred to a streptavidin coated micro plate (Pierce, cat. no.15124) and incubated for one hour at 37 °C. After washing the plate with phosphate buffered saline (PBST, 0.15 M Na<sup>+</sup>, pH 7.2, 0.05% Tween 20, 3x 300 $\mu$ l), 200  $\mu$ l of peroxidase labelled anti- DIG antibodies were added (Boehringer Manheim, diluted 1:1000 in PBST). Plates were incubated for 30 min at 37 °C and washed 15 (PBST, 3x 300 $\mu$ l). Wells were assayed for peroxidase activity by adding 100  $\mu$ l of substrate solution (0.1 M citrate-phosphate buffer pH 5.0, 0.66mg/ml ortho-phenylenediamine dihydrochloride, 0.012% H<sub>2</sub>O<sub>2</sub>). The reaction was stopped after 10 min by adding 100  $\mu$ l H<sub>2</sub>SO<sub>4</sub> (0.5 M) and the absorbance at 492 nm was read in a micro plate reader. When amplicons are denatured prior to hybridisation with the 20 capture probe (Figure 4A) we observe an efficient and sequence specific amplicon capture similar to that shown in Example 143. Increasing the concentration of the B-LNA2 from 1 to 5pmol leads to an increase in capture efficiency. A further increase to 25pmol of probe results in a decreased signal. This observation is consistent with saturation of the available biotin binding sites on the streptavidin MTP. When 25 amplicons are not denatured prior to hybridisation with the capture probe (Figure 4B) we also observe an efficient and sequence specific amplicon capture. In fact, the data shows that amplicon capture without denaturation are as effective and specific as amplicon capture with denaturation. This strongly indicates that the Bio-LNA2 probe is capable of binding to its target sequence by strand invasion. To our knowledge, this 30 constitutes the first example ever of sequence specific targeting of dsDNA under physiological salt conditions by a mixed purine/pyrimidine probe. Aside from its potential to significantly simplify a range of basic research and DNA diagnostic procedures this unexpected property of LNA modified oligos can be foreseen to be of

major importance in the development of efficient new drugs by the antisense, and in particular anti-gene approach.

**Example 145**

- 5 An LNA substituted oligo, immobilised on a solid surface function efficiently in the sequence specific capture of a PCR amplicon. Wells of a streptavidin coated microtiter plate (Boehringer Mannheim) were incubated for 1 hour with either 5 pmol of the B-DNA2 probe (biotin-GGTGGTTGTTG-3'; DNA probe specific for amplicon 2) or the B-LNA2 probe (biotin-GGTGGTTGTTG-3', LNA nucleosides in bold; LNA probe specific for amplicon 2) in a total volume of 100µl 1xSSC (0.15 M NaCl, 15mM citrate, pH 7.0). In total, four wells were incubated with the B-DNA2 probe, four wells with the B-LNA2 probe and four wells were incubated with buffer alone. After incubation the wells were washed three times with 1xSSC. DIG-labelled amplicon1(60µl) or amplicon2 (60µl) (prepared as in Example 143) were mixed with 15 540µl of 1 xSSC, heat denatured at 95°C for 5 min., and transferred (100µl) to the micro plate wells. Two of the wells containing either B-DNA2, B-LNA2 or no capture probe received amplicon1 and two of the wells containing B-DNA2, B-LNA2 or no capture probe received amplicon2. After 1 hour at 37°C the plate was washed 3 times with phosphate buffered saline (PBST, 0.15 M Na<sup>+</sup>, pH 7.2, 0.05% Tween 20, 3x 20 300µl) and 200 µl of peroxidase labelled anti- DIG antibodies were added (Boehringer Mannheim, diluted 1:1000 in PBST). Plates were incubated for 30 min at 37°C and washed 3 times with 300µl PBST. Wells were assayed for peroxidase activity by adding 100 µl of substrate solution (0.1 M citrate-phosphate buffer pH 5.0, 0.66mg/ml ortho-pheylenediamine dihydrochloride, 0.012% H<sub>2</sub>O<sub>2</sub>). The reaction was 25 stopped after 6 min by adding 100 µl H<sub>2</sub>SO<sub>4</sub> (0.5 M) and the absorbance at 492 nm was read in a micro plate reader. As shown in Figure 5, the LNA modified capture probe (B-LNA2) captures its specific amplicon (amplicon2) very efficiently and significantly better (approx. five fold increase in sensitivity) than the corresponding unmodified DNA capture probe (B-DNA2). No signal is obtained when the B-LNA2 30 probe is incubated with the unrelated amplicon (amplicon1) underscoring the exquisite specificity of the B-LNA2 probe. We conclude that LNA modified oligos function efficiently in the sequence specific capture of PCR amplicons when immobilised on a solid surface. We further conclude that the use of LNA modified oligos, in place of standard DNA oligos provide for a better signal to noise ratio. Thus, LNA offers a

means to significantly improve the performance of current DNA based assays that utilises immobilised capture probes, like for instance the array format wherein multiple immobilised probes are used to simultaneously detect the occurrence of several different target sequences in a sample.

**Example 146**

Fully mixed LNA monomers can be used to significantly increase the performance of

immobilised biotinylated-DNA oligos in the sequence specific capture of PCR

amplicons in a MTP format. Three DIG labelled amplicons from Nras sequence (ref.: 10 Nucleic Acid Research, 1985, Vol. 13, No. 14, p 52-55) were generated by PCR

amplification as follows:

PCR primers:

Forward primer: 5'-CCAGCTCTCAGTAGTTAGTACA-3' bases 701-723 according to the NAR reference.

15 910 bp reverse primer: 5'-GTAGAGCTTCTGGTATGACACA-3' bases 1612-1590

(reverse sequence according to NAR ref.).

600 bp reverse primer: 5'-TAAGTCACAGACGTATCTCAGAC-3' bases 1331-1308

(reverse sequence according to NAR ref.).

200 bp reverse primer: 5'-CTCTGTTTCAGACATGAAC TGCT-3' bases 909-886

20 (reverse sequence according to NAR ref.).

PCR reaction mixture for Nras amplicons: 2.3 µl human placental genomic DNA (440 ng/µl), 50 µl 10x PCR buffer (without MgCl<sub>2</sub> Perkin Elmer), 30 µl 25 mM MgCl<sub>2</sub>, 50 µl dNTP-mix (2 mM dATP, dCTP, dGTP and 1.8 mM dTTP), 10 µl 1 mM Dig-11-dUTP, 10 µl 25 µM forward primer, 10 µl 25 µM reverse primer, 5 µl 5 U/µl AmpliTaq Gold

25 (Perkin Elmer) and water ad 500 µl. PCR reaction: The above mixture was made for all the Nras PCR products. The only difference being reverse primer 910 bp, 600 bp or 200 bp added once at a time. The PCR mixtures were aliquoted into ten PCR tubes each and cycled in a Perkin Elmer 9600 at the following conditions: 95°C 3 min; 55°C 2 min, 72°C 3 min, 95°C 1 min (30 cycles); 55°C 2 min, 72°C 10 min and

30 4°C soak. 10 µl from each PCR reaction was analysed on a standard agarose gel and the expected fragments of approximately 910 bp, 600 bp and 200 bp were observed.

Assay conditions: Wells of a streptavidin coated micro-titer plate (Boehringer

Mannheim; binding capacity of 20 pmol biotin per well) were incubated for 1 hour in 5 x SSCT (0.75 M NaCl, 75 mM citrate, pH 7.0, 0.1% Tween 20) at 37°C with either 1

pmol of DNA Nras Cap A (biotin-5'-TTCCACAGCACAA-3'), LNA/DNA Nras Cap A (biotin-5'-TTCCACAGCACAA-3'), LNA Nras Cap A (biotin-5'-TTCCACAGCACAA-3'), DNA Nras Cap B (biotin-5'-AGAGCCGATAACA-3'), LNA/DNA Nras Cap B (biotin-5'-AGAGCCGATAACA-3') or LNA Nras Cap B (biotin-5'-AGAGCCGATAACA-3'); LNA

5 nucleosides in bold. The Nras Cap A capture probes capture amplicons Nras 910, Nras 600 and Nras 200. Nras Cap B capture probes capture specific amplicons Nras 910 and Nras 600. After incubation with the different capture probes, the wells were washed in 5 x SSCT and 5 µl native or denatured (95 ° C 5 min and 10 min on ice) DIG-labelled amplicons (Nras 910, Nras 600 or Nras 200) in 95 µl 1 x SSCT (0.15 M

10 NaCl, 15 mM citrate, pH 7.0, 0.1% Tween 20) were added per well and incubated for 1 hour at 37 ° C. The wells were washed three times in phosphate buffered saline (1 x PBST, 0.15 M Na<sup>+</sup>, pH 7.2, 0.05% Tween 20) and incubated 30 min at 37 ° C with 200 µl peroxidase labelled anti-DIG antibodies (Boehringer Mannheim, diluted 1:1000 in 1 x PBST). Finally the wells were washed three times in 1 x PBST and assayed for

15 peroxidase activity by adding 100 µl of substrate solution (0.1 M citrate-phosphate buffer pH 5.0, 0.66 mg/ml ortho-pheylenediamine dihydrochloride, 0.012% H<sub>2</sub>O<sub>2</sub>) the reaction was stopped after 9 min by adding 100 µl 0.5 M H<sub>2</sub>SO<sub>4</sub> and diluted 4 times in H<sub>2</sub>SO<sub>4</sub> before the absorbance at 492 nm was read in a micro-titer plate reader. As shown in Figure 23A, capture probes spiked with 12 LNA nucleosides (LNA Nras Cap

20 A and LNA Cap B) capture very efficiently the specific amplicons without prior denaturation (native amplicons). Capture probes spiked with 4 LNA nucleosides (LNA/DNA Nras Cap A and LNA/DNA Nras Cap B) capture the same amplicons with a lower efficiency and the DNA capture probes (DNA Nras Cap A and DNA Nras Cap B) do not capture the specific amplicons at all. The control amplicon, Nras 200, are not

25 captured by the LNA Cap B or the LNA/DNA Nras Cap B probes demonstrating the exquisite specificity of the LNA spiked capture probes. Figure 23B shows the same experiment performed with denatured amplicons. Essentially the same picture emerges with the essential difference that capture efficiencies are generally increased. We conclude that LNA modified oligos containing mixed LNA nucleosides (A, T, G or C

30 LNA nucleosides) function efficiently in sequence specific capture of PCR amplicons when immobilised on a solid surface. We further conclude that LNA offers a means to construct capture probes that will function efficiently in amplicon capture without prior denaturation i.e. capture by strand displacement. This ability facilitates a significant simplification of current amplicon detection formats based on DNA.

**Example 147**

LNA modified oligos function as primers for nucleic acid polymerases. The ability of an LNA modified oligo (5'-GGTGGTTTGTG-3', LNA nucleosides in bold) to serve as a primer in template dependent, enzymatic elongation were investigated with 3 different classes of polymerases. A reverse transcriptase M-MuLV (Boehringer Mannheim) which can use both RNA and DNA as template, the Klenow polymerase which is representative of standard DNA polymerases and a thermostable polymerase, BM-TAQ (Boehringer Mannheim). As control the extension reactions were conducted using the identical unmodified DNA primer (5'-GGTGGTTTGTG-3'). The LNA and DNA primers were labelled with  $^{32}$ P- $\gamma$ -ATP as previously described in Example 137. A 50mer DNA oligo (5'-AAAAATCGACGCTCAAGTCAGAAAAGCATCTCACAAACAAACAAAC-CACC-3') was used as template. The reaction with *M-MuLV* (Boehringer Mannheim,) contained 2 $\mu$ l of either labelled LNA-primer or DNA primer (10 $\mu$ M), 2 $\mu$ l of DNA template (10 $\mu$ M), 2 $\mu$ l of 2mM dNTP, 2 $\mu$ l of 10 x buffer (500mM Tris-HCl, 300mM KCl, 60mM MgCl<sub>2</sub>, 100mM DTT, pH 8.3 (37°C)), 1 $\mu$ l of enzyme (20U/ $\mu$ l) and water to 20 $\mu$ l. The reactions were incubated at 37°C for 60 min. The reaction with *Klenow polymerase* (USB) contained 2 $\mu$ l of either labelled LNA or DNA primer (10 $\mu$ M), 2 $\mu$ l of DNA template (10 $\mu$ M ), 2 $\mu$ l of 2mM dNTP, 2 $\mu$ l of 10 x buffer (100mM Tris-HCl, 50mM MgCl<sub>2</sub>, 75mM DTT, pH 7.5), 1 $\mu$ l of enzyme (10U/ $\mu$ l) and water to 20 $\mu$ l. The reactions were incubated at 37°C for 60 min. The reaction with *BM-Taq* (Boehringer Mannheim) contained 2 $\mu$ l of either labelled LNA or DNA-primer (10 $\mu$ M), 2 $\mu$ l of DNA template (10 $\mu$ M), 2 $\mu$ l of 2mM dNTP, 2 $\mu$ l of 10 x buffer (100mM Tris-HCl, 15mM MgCl<sub>2</sub>, 50mM KCL, pH 8.3), 1 $\mu$ l of enzyme (5U/ $\mu$ l) and water to 20 $\mu$ l. The reactions were incubated at a starting temperature of 37°C and ramped at 1°C/min to 60°C where they were maintained for 30min. At the end of the incubation period the reactions were stopped by the addition of 10 $\mu$ l of loading buffer (0.25% (w/v) bromophenol blue, 0.25% (w/v) xylene cyanol, 80% (v/v) formamid). The samples were heated to 95°C for 1 min., placed on ice and 2 $\mu$ l was loaded onto a 8% sequencing polyacrylamide gel and electrophoresed on a Life Technologies Inc. BRL model 52. After electrophoresis the gel was dried on the glass plate and subjected to autoradiography (X-ray film: Kodak X-Omat AR). As shown in Figure 7, clear and similar extension products are observed with both the LNA and DNA primer when either the Klenow polymerase (lanes 3) or the BM-Taq polymerase (lanes 5) is used.

When M-MuLV reverse transcriptase is used (lanes 2) an extension product can be detected only in the case of the LNA-primer. The labelled LNA and DNA primer that have not been subjected to enzymatic elongation are present in lanes 1, 4 and 6. We conclude that the incorporation of LNA nucleosides into standard DNA oligos does not prevent recognition of the oligo/template duplex by nucleic acid polymerases. We further conclude that LNA modified oligos act as efficiently as primers as unmodified DNA oligos.

#### Example 148

- 10 LNA modified oligo functions as primers in target amplification processes. The ability of LNA modified oligos to act as primers in PCR amplification was analysed with three oligos differing only in the number of LNA nucleosides they contained: 4 LNA nucleosides (AL2 primer: 5'-GGTGGTTTGT<sup>b</sup>TTG-3', LNA nucleosides in bold), 1 LNA nucleoside (AL10 primer: 5'-GGTGGTTTGT<sup>b</sup>TTG-3', LNA nucleoside in bold) and no LNA nucleoside (FP2 primer: 5'-GGTGGTTTGT<sup>b</sup>TTG-3'). The PCR reactions (100µl) contained either no template (control), 0.01ng, 0.1ng or 1ng of template (pUC19 plasmid), 0.2µM reverse primer (5'-GTGGTTCGCTCCAAGCTG-3'), 0.2µM of either the AL2, AL10 or FP2 forward primer, 200µM of dATP, dGTP, dCTP and dTTP, 10mM Tris-HCl pH 8.3, 1.5mM MgCl<sub>2</sub>, 50mM KCl and 2.5U of the BM-Taq polymerase. A total of 50 cycles each consisting of 94°C 1min. - 45°C 1min. - 72°C 1.5min. were conducted (with an additional 2.5U of Taq polymerase added after the first 30 cycles) on a Techne Genius thermocycler. After the final cycle the reactions were incubated at 72°C 3min. and then at 4°C overnight. To 30µl of each reaction was added 6µl of loading buffer (0.25% (w/v) bromophenol blue and 40% (v/v) glycerol) and the samples (together with a Amplisize™ size marker) were loaded onto a 2% agarose gel and electrophoresed for 45min. at 150V. Finally, the gel was stained with ethidiumbromid and photographed. As shown in Figure 8 the PCR reactions using the unmodified forward primer FP2 and unmodified reverse primer generates detectable amplicons of the correct sizes with all amounts of template used (lane 9: 0.01ng template, lane 10: 0.1ng and lane 11: 1ng). No signal is obtained in the control reaction without template (lane 12). When the FP2 forward primer is replaced by the primer containing 1 central LNA nucleoside (AL10) amplicons are also detected with all amounts of template used (lane 5: 0.01ng, lane 6: 0.1ng and lane 7: 1ng). This clearly indicates that the AL10 primer sustains an exponential amplification. i.e. the

AL10 primer can be both extended and used as template in its entirety. Again, the control reaction without template (lane 8) does not produce an amplicon. When the FP2 forward primer is replaced by the primer containing 4 central LNA nucleosides (AL2), amplicons of the correct size cannot be detected in any of the reactions. (lane 5 1: 0.01ng template, lane 2: 0.1ng, lane 3: 1ng and lane 4: no template). With the highest concentration of template (1ng), however, a high molecular weight band appears in the gel (lane 3). This, however, is an artefact of the RP1 primer as indicated by the control reaction wherein each of the primers AL2 (lane A), AL10 (lane B), FP2 (lane C) and RP1 (lane D) were tested for their ability to produce an amplicon 10 with the highest amount of template (1ng). Since AL2 was shown to act as a primer in Example 147, the absence of detectable amplicons strongly indicates that it lacks the ability to act as a template, *i.e.* the block of 4 consecutive LNA nucleosides blocks the advance of the polymerase thereby turning the reaction into a linear amplification (the product of which would not be detectable by the experimental set-up used). We 15 conclude that LNA modified oligos can be used as primers in PCR amplification. We further conclude that the degree of amplification (graded from fully exponential to linear amplification) can be controlled by the design of the LNA modified oligo. We note that the possibility to block the advance of the polymerase by incorporating LNA nucleosides into the primer facilitates the generation of amplicons carrying single 20 stranded ends. Such ends are readily accessible to hybridisation without denaturation of the amplicon and this feature could be useful in many applications.

#### Example 149

An LNA modified oligomer carrying a 5' anthraquinone can be covalently immobilised 25 on a solid support by irradiation and the immobilised oligomer is efficient in the capture of a complementary DNA oligo. Either 25 pmol/ $\mu$ l or 12.5 pmol/ $\mu$ l of an anthraquinone DNA oligo (5'-AQ-CAG CAG TCG ACA GAG-3') or an anthraquinone LNA modified DNA oligo (5'-AQ-CAG CAG TCG ACA GAG-3'; LNA monomer is underlined) was spotted (1  $\mu$ l/spot) in 0.2 M LiCl on a polycarbonate slide (Nunc). The 30 oligos were irradiated for 15 min with soft UV light. After irradiation the slide was washed three times in Milli-Q water and air-dried. 25ml of 0.5 pmol/ $\mu$ l of complimentary biotinylated oligomer (5'-biotin- CTC TGT CGA CTG CTG-3') was hybridised to the immobilised oligomers in 5 x SSCT (75 mM Citrate, 0.75 M NaCl, pH 7.0, 0.1% Tween 20) at 50°C for 2 hours. After washing four times with 1 x SSCT

and one time phosphate buffered saline (PBST, 0.15 M Na<sup>+</sup>, pH 7.2, 0.05% Tween 20), 25ml PBST containing 0.06 µg/ml streptavidin conjugated horse radish peroxidase and 1 µg/ml streptavidin were added to the slide. The slide was incubated for 30 min and washed 4 times with 25ml PBST. The slide was visualised by using chemiluminescent substrate (SuperSignal; Pierce) as described by the manufacturer and X-ray film (CL-Xposure film, Pierce 34075). As shown in Figure 9 both the AQ-DNA oligo and the AQ-LNA modified DNA oligo yields a clearly detectable signal. We conclude that anthraquinone linked LNA modified DNA oligos can be efficiently attached to a solid surface by irradiation and that oligos attached in this ways are able 10 to hybridise to their complementary target DNA oligos.

Boxes were covered with aluminium foil to keep light out, and incubated at 5 +4°C overnight.

**Slide Washes:** Coverslips were removed and the slides inserted in racks (6 slides per rack) which were placed in glass slide dishes, wrapped in foil:

- 10 After washing, slides were blow-dried and scanned. The fluorescence was imaged on a slide scanner and the data analysed from ImageQuant software (Molecular Dynamics). As shown in Figure 11, no binding of the Cy3 labelled probes is observed to the mismatched oligo 3 with either the unmodified probe (slide 10-12), single LNA modified probe aZ1 (slide 1-3) single LNA modified probe aZ2 (slide 4-6) or triple LNA 15 modified probe aZ3 (slide 7-9) (i.e. the obtained signal with the mismatched oligo 3 is comparable to the background signal). With complementary oligo 6, specific signals are observed in all cases. The intensity of these signals clearly correlates with the number of LNAs present in the probes and with the concentration of the probes. Each LNA T residue approximately increased the signal strength by about a factor of 2 over 20 that of the normal DNA oligo probe, i.e. aZ1 and aZ2 = 2x signal of sequence 16, and aZ3 = 8x signal of sequence 16. The match/mismatch discrimination is good with the LNA T base replacements, and with the increased signal strength, the mismatch discriminations appear to be easier.

*Slides and conditions for hybridisation:* Each probe sequence was hybridised on a separate slide, and all probe concentrations were 1fmol/ $\mu$ l. Each probe was diluted in hybridisation buffer (5 x SSC, 7% sodium lauryl sarcosine), of which 30 $\mu$ l was

pipetted along the length of each slide, covered with a coverslip, and placed into a plastic box on top of a plastic insert, which was lying on a paper towel wetted with water. Boxes were covered with aluminium foil to keep light out, and incubated at +4°C overnight.

All slides were washed in 5 x SSC for 2 x 5 min at +4°C. After washing, slides were blow-dried and scanned. The fluorescence was imaged on a slide scanner and the data analyzed from

10 ImageQuant software (Molecular Dynamics).

*Conclusions:* As shown in Figures 12 and 13, probes containing LNA nucleosides at their 5' and 3' ends are in the majority of cases significantly better in discriminating between matched and mismatched target sequences than their corresponding

15 unmodified oligonucleotides.

For DNA oligos, C=T mismatches were the most difficult to distinguish, for example, where probe sequence 1 hybridised to target sequence 132 and where probe sequence 5 hybridised to target sequence 134. Other mismatches were visible such as

20 T=T and G=T mismatches, but these spots were less intense, for example where probe sequences 5 and 6 respectively hybridised to target sequence 135. The LNA oligos, significantly reduced these C=T and T=T mismatch spot intensities, to comparable levels to other mismatches. The relative spot intensities of probe sequences 1, 2 and 3 were similar for the DNA and LNA oligos. However, with probe

25 sequences 4, 5 and 6, the LNA oligos gave a significantly increased spot intensity when hybridised to their match target sequences 9, 133 and 134 respectively.

*Slides and conditions for hybridization:* Each probe sequence was hybridized on a  
10 separate slide, and all probe concentrations were 1 fmol/ $\mu$ l. Each probe was diluted in hybridization buffer (5 x SSC, 7% sodium lauryl sarcosine), of which 30  $\mu$ l was pipetted along the length of each slide, covered with a coverslip, and placed into a plastic box on top of a plastic insert, which was lying on a paper towel wetted with water. Boxes were covered with aluminium foil to keep light out, and incubated at  
15 room temperature overnight.

*Slide Washes:* Coverslips were removed and the slides inserted in racks (9 slides per rack) which were placed in glass slide dishes, wrapped in foil.  
All slides were washed in 5 x SSC for 2 x 5 minutes at RT. After washing,  
20 slides were blow-dried and scanned. The fluorescence was imaged on a slide scanner and the data analyzed from ImageQuant software (Molecular Dynamics).

*Conclusion:* As shown in Figures 15A, 15B and 15C, The average intensity of  
25 DNA hybridization at room temperature was about 10% of the intensity achieved with the AT or all LNA modified oligos. No spots were seen on slides hybridized with DNA probes 5 and 6. These conditions were therefore not optimal for the DNA probes. However, the match / mismatch discrimination is very good with the LNA nucleoside replacements at the A and T bases. The  
30 stringency for the all LNA oligos may not be great enough as the match / mismatch discrimination was not as good as for the AT LNA oligos.

The oligos with LNA modifications worked very well, and the mismatches that were the most difficult to discriminate were;

Probe 1 to target 135 = CT mismatch

Probe 2 to target 131 = GT mismatch

5 Probe 3 to target 15 = AA mismatch

Probe 4 to target 131 = CT mismatch

Probe 5 to target 135 = TT mismatch

Probe 6 to target 135 = GT mismatch

Probe 6 to target 133 = GA mismatch

10

The AT LNA oligos gave good discrimination where these mismatch spot intensities were typically at the most 50% of the intensity of the match spots. For these mismatches, the all LNA oligos gave mismatch spot intensities about 50 to 70% of the match spot intensities. Overall, LNA modifications allows the 15 use of higher temperatures for hybridizations and washes, and end mismatches can be discriminated. These results are at least as good as those from DNA probes hybridised at 4°C (see example 151).

20 Use of [ $\alpha^{33}\text{P}$ ] ddNTP's and ThermoSequenase™ DNA Polymerase to Sequence DNA Templates Containing LNA T Monomers. Radiolabelled terminator sequencing reactions were set up in order to test the ability of the LNA T monomer to be accepted as a template for DNA polymerases. The 15mer primer (sequence: 5'- TGC ATG TGC TGG AGA -3') was used to prime the following short oligonucleotide sequences (LNA 25 monomer in bold):

15 2 $\mu$ l Nucleotide mix (7.5 $\mu$ M each dNTP) was added to each of 8 Eppendorf tubes. 0.5 $\mu$ l [ $\alpha^{33}$ P] ddATP was added to tubes 1 and 5. 0.5 $\mu$ l [ $\alpha^{33}$ P] ddCTP was added to tubes 2 and 6. 0.5 $\mu$ l [ $\alpha^{33}$ P] ddGTP was added to Tubes 3 and 7. 0.5 $\mu$ l [ $\alpha^{33}$ P] ddTTP was added to tubes 4 and 8. 4.5 $\mu$ l of Template 1 mix was added to each of tubes 1-4. 4.5 $\mu$ l of Template TZ1 mix was added to each of tubes 5-8. All the reactions were 20 incubated at 60°C for 3 min. The reactions were stopped by the addition of 4 $\mu$ l formamide/EDTA stop solution. Reactions were heated at 95°C for 3 min before loading onto a 19% polyacrylamide 7M urea gel. The gel was fixed in 10% acetic acid 10% methanol before transferring to 3MM paper and drying. The dried gel was exposed to Kodak Biomax autoradiography film.

25 The results are depicted in Figure 18 (track 1-4) and Figure 19 (5-8). The tracks correspond to the following reactions: (Figure 18): Lane 1 - ddATP track. Lane 2 - ddCTP track. Lane 3 - ddGTP track, Lane 4 - ddTTP track. Lane 5 - 8-32 base oligo markers; Figure 19: Lane A - 8-32 base oligo markers. Lane 5 - ddATP track. Lane 6 - 30 ddCTP track. Lane 7 - ddGTP track. Lane 8 - ddTTP track.

As is evident from Figures 18 and 19, the full sequence of both templates can easily be read from the autorad. The sequence is 5'-TGG AAC GTA- 3' which corresponds to

the template sequence 3'-ACC TTG CTA- 5'. This shows that a single LNA T monomer can act as a template for DNA polymerases. The LNA T monomer is specifically copied as "T" with ddATP being incorporated.

## 5 Therapeutic applications

### Example 154

LNA modified oligos can be transferred into cells. Experiment with radiolabelled LNA oligos. 10 pmol of a oligodeoxynucleotide (ODN) (ODN#10: 5'-TTA ACG TAG GTG 10 CTG GAC TTG TCG CTG TTG TAC TT-3', a 35-mer complementary to human Cathepsin D ) and 10 pmoles of two LNA oligos: AL16 (5'-d(**TGT GTG AAA TTG TTA** T)-3', LNA nucleosides in bold) and AL17 (5'-d(**ATA AAG TGT AAA G**)-3', LNA nucleosides in bold) were mixed with T4 polynucleotide Kinase (10 units, BRL cat. no. 510-8004SA), 5 µl gamma <sup>32</sup>P-ATP 5000 Ci/mmol, 10 uCi/µl (Amersham) in kinase 15 buffer (50 mM Tris/HCl pH 7.6, 10 mM MgCl<sub>2</sub>, 5 mM DTT, 0.1 mM EDTA). The samples were incubated for 45 min at 37°C and afterwards heated to 68°C for 10 min, and then moved to +0 °C. Unincorporated nucleotides were removed by passage over Chroma Spin TE-10 columns (Clontech cat. no. K1320-1). The yields were 5x10<sup>5</sup> cpm/µl , 2x10<sup>5</sup> cpm/µl and 0.8x10<sup>5</sup> cpm/µl for ODN#10, AL16 and AL17, 20 respectively. MCF-7 human breast cancer cells originally obtained from the Human Cell Culture Bank (Mason Research Institute, Rockville) were cultured in DME/F12 culture medium (1:1) supplemented with 1% heat inactivated fetal calf serum (Gibco BRL), 6 ng/ml bovine insulin (Novo) and 2.5 mM glutamax (Life Technologies) in 25 cm<sup>2</sup> cell culture flasks (Nunclon, NUNC) and incubated in a humified incubator at 37°C, 25 5%CO<sub>2</sub>, 20%O<sub>2</sub>, 75%N<sub>2</sub>. The MCF-7 cells were approximately 40% confluent at the time of the experiment. A small amount (less than 0.1 pmol) of the kinased oligos were mixed with 1.5 µg pEGFP-NI plasmid (Clontech cat. no. 60851) and mixed with 100 µl diluted FuGENE6 transfection agent (Boehringer Mannheim cat no. 1 814 443), dilution: 5µl FuGENE6 in 95 µl DME/F12 culture medium without serum. The 30 FuGENE6/DNA/oligo-mixture were added directly to the culture medium (5 ml) of adherent growing MCF-7 cells and incubated with the cells for 18 hours, closely following the manufacturers directions. Three types of experiments were set up. 1) ODN#10 + pEGFP-NI; 2) AL16 + pEGFP-NI; 3) AL17 + pEGFP-NI. Cellular uptake of DNA/LNA material were studied by removing FuGENE6/DNA/oligo-mixture containing

medium (an aliquot was transferred to a scintillator vial). Cells were rinsed once with phosphate buffered saline (PBS), fresh culture medium was added and cells inspected by fluorescence microscopy. Approximately 30% of the transfected cells contained green fluorescent material, indicating that approximately 30% of the cells have taken

- 5 up the pEGFP-NI plasmid and expressed the green fluorescent protein coded by this plasmid. Following fluorescence microscopy the adherent MCF-7 cells were removed from the culture flasks. Briefly, the culture medium was removed, then cells were rinsed with a solution of 0.25% trypsin (Gibco BRL) 1 mM EDTA in PBS (without Mg<sup>2+</sup> and Ca<sup>2+</sup>), 1 ml trypsin/EDTA was added and cells were incubated 10 min at  
10 37°C. During the incubation the cells loosened and were easily resuspended and transferred to scintillator vials. The cells were then completely dissolved by addition of 10 ml Optifluor scintillation cocktail (Packard cat. no. 6013199), and the vials were counted in a Wallac 1409 scintillation counter. The results were as follows: 1)  
ODN#10 + pEGFP-NI: approximately 1.4% of the added radioactivity were associated  
15 with cellular material; 2) AL16 + pEGFP-NI: approximately 0.8% of the added radioactivity were associated with cellular material; and 3) AL17 + pEGFP-NI:  
approximately 0.4% of the added radioactivity were associated with cellular material.  
We conclude that 0.4 - 0.8% of the added LNA oligos were taken up by the cells.

**LNA is efficiently delivered to living human MCF-7 breast cancer cells.** To increase the efficiency of LNA-uptake by human MCF-7 cells different transfection agents were tested with various concentrations of 5'FITC-labelled LNAs and DNA. The oligonucleotides described in the table below were tested.

Table: Oligonucleotides tested

Name	Sequence (LNA monomers in bold)	Characteristics

EQ3008-01	5'-TGC CTG CAG GTC GAC T-3'	DNA-FITC-labeled

AL16 and AL17 were enzymatically labelled with FITC as described in Example 128.

- 5 EQ3009-01 and EQ3008-01 were labelled with FITC by standard solid phase chemistry. Three transfection agents were tested: FuGENE-6 (Boehringer Mannheim cat. no. 1 814 443), SuperFect (Qiagen cat. no. 301305) and Lipofectin (GibcoBRL cat. no. 18292-011). Human MCF-7 breast cancer cells were cultured as described previously (Example 154). Three days before the experiments the cells were seeded at 10 a cell density of approx.  $0.8 \times 10^4$  cells per  $\text{cm}^2$ . Depending on the type of experiment the MCF-7 cells were seeded in standard T25 flasks (Nunc, LifeTechnologies cat. no. 163371A), 24 wells multidish (Nunc, LifeTechnologies cat. no. 143982A) or slide flasks (Nunc, LifeTechnologies cat. no. 170920A). The experiments were performed when cells were 30 - 40 % confluent. Cellular uptake of LNA and DNA was studied at 15 serum-free conditions, i.e. the normal serum containing DME/F12 medium was removed and replaced with DME/F12 without serum before the transfection-mixture was added to the cells. Under these conditions SuperFect proved to be toxic to the MCF-7 cells. Transfection mixtures consisting of SuperFect and either plasmid DNA (pEGFP-N1, Clontech cat. no. 6085-1), oligo DNA or oligo LNA was equally toxic to 20 MCF-7 cells. In contrast to SuperFect, FuGene6 and Lipofectin worked well with plasmid DNA (pEGFP-N1). However, only lipofectin was capable of efficient delivery of oligonucleotides to living MCF-7. Briefly, efficient delivery of FITC-labelled LNA and DNA to MCF-7 cells was obtained by culturing the cells in DME/F12 with 1% FCS to approx. 40% confluence. The Lipofectin reagent was then diluted 40 X in DME/F12 25 medium without serum and combined with the oligo to a concentration of 750 nM

oligo. The oligo-Lipofectin complex was allowed to form for 15 min at r.t., and further diluted with serum-free medium to a final concentration of 250 nM oligo, 0.8 ug/ml Lipofectin. Then, the medium was removed from the cells and replaced with the medium containing oligo-Lipofectin complex. The cells were incubated at 37°C for 6 hours, rinsed once with DME/F12 medium without serum and incubated for a further 18 hours in DME/F12 with 1% FCS at 37°C. The result of the experiment was evaluated either directly on living cells in culture flasks or in 24 wells multidishes or on cells cultured in slide flasks and fixed in 4% ice-cold PFA. In all cases a Leica DMRB fluorescence microscope equipped with a high resolution CCD camera was used. The result with living cells is shown in Figure 16 and the result with fixed cells cultured in slide flask is shown in Figure 17. Both the cells in Figures 16 and 17 were transfected with the FITC-labelled AL16 LNA molecule. By counting total number of cells and green fluorescent cells in several fields we observe that FITC-labelled AL16 LNA was transfected into approximately 35% of the MCF-7 cells. Importantly, we saw that the LNA predominantly was localised in the nuclei of the cells (Figure 17). This is noteworthy, since nuclear uptake of fluorescent oligos correlates with their antisense activity (Stein C.A. et al. (1997) Making sense of antisense: A debate. In HMS Beagle: A BioMedNet Publication (<http://hmsbeagle.com/06/cutedge/overwiev.htm>)). Increasing the amount of oligo and lipofectin up to a final concentration of 1250 nM oligo and 4 ug/ml lipofectin only increased the percentage of green fluorescent cells marginally. Increasing the concentration even further was toxic for the cells. Similar results were obtained with the other LNAs and the FITC-labelled oligo DNA (see the table above). We conclude that: 1) LNA can be efficiently delivered to living MCF-7 breast cancer cells by Lipofectin-mediated transfection. 2) A consistent high fraction, 30% or more of cells, is transfected using a final concentration of 250 nM LNA, 0.8 ug Lipofectin pr. ml growth medium without serum. Increasing the concentrations of LNA and Lipofectin up to 5 times only increased the transfection yield marginally. 3) The procedure transfected the LNA into the nuclei of the cells, which according to literature is a good indication that such transfected LNAs may exhibit antisense effects on cells.

#### Example 156

LNA modified oligos can be transferred into cells. Experiment with fluorescein labelled LNA oligos. Two LNA oligos: AL16 (5'-TGT GTG AAA TTG TTA T-3', LNA

nucleosides in bold) and AL17 (5'-ATA AAG TGT AAA G-3', LNA nucleosides in bold) were labeled with fluorescein as described in Example 128. MCF-7 human breast cancer cells were cultured as described in Example 154. Three types of experiments were set up. 1) approximately 1.5 µg FITC-labelled AL16; 2) approximately 1.5 µg 5 FITC-labelled AL17; and 3) approximately 0.75 µg FITC-labelled AL16 and 0.75 µg pRSVβgal plasmid (a plasmid expressing the bacterial lac Z gene coded enzyme β-galactosidase, Tulchinsky et. al. (1992) PNAS, 89, 9146-50). The two LNA oligos and the LNA-plasmid mix were mixed with FuGENE6 and added to MCF-7 cells as described in Example 154. After incubation for 18 hours cellular uptake of the LNA 10 oligos were assessed by fluorescence microscopy of the cell cultures. A part of the treated cells contained green fluorescent material (see Figure 16), indicating that cells take up the fluorescein labelled LNA. The fluorescein labelled AL16 appeared superior to fluorescein labelled AL17 in this respect. After fluorescence microscopy the culture medium were removed from the cells treated both with fluorescein labelled AL16 and 15 pRSVβgal. The cells were washed once with PBS, fixed in 2% (v/v) formaldehyde, 0.2% (v/v) glutaraldehyde at 4°C for 5 min and β-galactosidase containing cells were stained blue with X-gal (5-bromo-4-chloro-3-indoyl β-D-galactopyranosid) which turns from colorless to blue in the presence of β-galactosidase activity. The X-gal staining showed that the pRSVβgal effectively had been transferred into cells. We conclude 20 that the fluorescein LNA oligos were taken up by the cells.

#### Example 157

LNA modified oligos are relatively stable under cell culture conditions. Following 25 fluorescence microscopy as described in Example 156 cells treated only with the fluorescein labelled AL16 LNA were allowed to incubate for an additional 3 days. During this period of time the number of green fluorescent cells appeared unaltered. We conclude that fluorescein labelled LNA oligos has a good stability under the conditions prevailing in cell culture.

#### 30 Example 158

**Blockade by Antisense Locked Nucleic Acids (LNA) of [D-Ala2]Deltorphin-Induced Antinociception in the Warm Water Tail Flick Test in Conscious Rats.** Male Sprague-Dawley rats (300 g) were implanted with an intrathecal (i.th). polyethylene catheter and allowed to recover for at least 5 days before start of injections (including

controls). The antisense LNA compounds (12.5 and 2.5 µg per injection) were administered in a 5 µl volume twice-daily (08.00 and 17.00 h) for 3 days. No signs of non-specific effects or toxicity could be detected, as shown by observations of locomotor behavior and measurements of body weight. The day after the last injection 5 the rats were injected with [D-Ala<sub>2</sub>]deltorphin (60µg, i.th) and tested in the warm water (52°C) tail flick test for δ opioid receptor-mediated antinociception. Data are presented in Figure 14 as medians based on 6-8 animals per group (data converted to percent maximum possible response, % MPE). Statistical analyses were performed by means of Kruskal-Wallis 1-way ANOVA by ranks, followed by comparisons of 10 treatments versus control. As shown in Figure 14, deltorphin produced a robust antinociceptive effect in saline-treated controls. This response was statistically significantly suppressed in both antisense LNA groups (12.5 and 2.5 µg) as compared with saline-treated controls.

## 15 LNA Solid Supports

### Example 159

**General method for DMT-LNA nucleoside succinates.** Base protected DMT-LNA nucleoside and succinic anhydride (1.5 equivalents) were taken in anhydrous ethylene dichloride (~10 ml/g of nucleoside). To the mixture, triethylamine (2 equivalents) was added and the mixture was stirred at room temperature. Reaction was followed by HPLC (conditions same as for tritylation). After complete reaction (>95%), reaction mixture was concentrated, coevaporated with ethylene dichloride and acetonitrile, and dried *in vacuo* to remove triethylamine. Residue was dissolved in ethylene dichloride or 25 ethyl acetate (~100 ml/g of starting nucleoside), washed with cold 10% citric acid (3 x 80 ml/g) and cold water (3 x 80 ml/g). Organic layer was dried over anhydrous sodium sulfate, filtered and concentrated with or without addition of 1-2 equivalents of triethylamine. Residual solid was coevaporated with anhydrous acetonitrile (2-3x) and dried *in vacuo* to give pure product as white solid.

30 **General method for LNA nucleoside supports.** Base protected DMT-LNA-nucleoside succinate (free acid or triethylammonium salt, 65 micromol/g of support), amino derivatised support (Primer Support™ 30HL, 160 micromol amino groups/g of support), DMAP (3 mg/g of support) and 1-(3-[dimethylamino]propyl)-3-ethylcarbodiimide hydrochloride (80 mg/g of support) were taken in anhydrous pyridine

(6 ml/g of support). To this mixture, triethylamine (16 microliter/g of support) was added and the mixture was kept on a shaker at 150 rpm overnight. Support was filtered, washed with methanol (3 x 10 ml/g of support) and dichloromethane (3 x 10 ml/g of support). After air drying, support was dried *in vacuo* for 0.5h. To this 6% DMAP in anhydrous acetonitrile (Cap A, ~ 3 ml/g of support) and a mixture of 20% acetic anhydride/ 30% 2,4,6-collidine/ 50% acetonitrile (Cap B, ~ 3 ml/g of support) were added. The mixture was kept on shaker for 5h. Support was filtered, washed with anhydrous dichloromethane (2 x 10 ml/g of support) and dried as above. It was resuspended in a mixture of Cap A and Cap B (total vol. 6 ml/g of support) and kept 10 on shaker overnight. Support was filtered, washed with methanol (6 x 10 ml/g of support), dichloromethane (3 x 10 ml/g of support) and dried in air. It was further dried *in vacuo* for 5-6h. Loading was determined by dimethoxytrityl assay and was found to be approx. 40  $\mu$ mol/g.

#### 15 Example 160

##### First Strand cDNA Synthesis Using Poly dT Primers Containing LNA T monomers.

Reactions were set up in order to test the ability of poly dT primers containing LNA T residues to prime 1<sup>st</sup> strand cDNA synthesis. The following poly dT primers were tested (LNA monomers are in bold):

20 RTZ1 5'-TTT TTT TTT TTT TT-3'  
RTZ2 5'-TTT TTT TTT TTT TT-3'  
RTZ3 5'-TTT TTT TTT TTT TT-3'  
RTZ4 5'-TTT TTT TTT TTT TT-3'  
RTZ5 5'-TTT TTT TTT T-3'

25 Anchored poly dT primer from RPK0140 kit Cy Dye cDNA labelling kit (Amersham Pharmacia Biotech) was as a control.

Reactions were set up as follows for each of the primers above:

30 1 $\mu$ l Arabidopsis mRNA 0.5 $\mu$ g/ $\mu$ l  
2 $\mu$ l poly dT primer 8pmoles/ $\mu$ l  
4 $\mu$ l x5 AMV Reverse Transcriptase buffer  
1 $\mu$ l Water  
8 $\mu$ l Total volume

This mix was then heated to 75°C for 3 min and then allowed to cool at room temperature for at least 10 min.

The following was then added to each of the reactions:

- 5            1µl    80mM Sodium Pyrophosphate  
              1µl    Human Placental Ribonuclease Inhibitor 20U/µl  
              7µl    0.5mM dNTP solution  
              2µl    [ $\alpha^{33}\text{P}$ ] dATP 10mCi/ml 3000Ci/mmol  
              1µl    AMV Reverse Transcriptase 20U/µl  
10            20µl   Total volume

The reactions were incubated at 42°C for 2 hours. The reactions were then heated at 95°C for 3 min before loading onto a 6% polyacrylamide 7M urea gel. The gel was fixed in 10% acetic acid / 10% methanol before transferring to 3MM paper and drying. The dried gel was exposed to Kodak Biomax autoradiography film overnight.

- 15           The autoradiograph clearly showed that the LNA containing oligonucleotide primers RTZ1-4 were able to efficiently prime cDNA synthesis. The amount and intensity of the cDNA products produced in these reactions was equal to that produced with the anchored poly dT control oligonucleotide. RTZ 5 did produce some cDNA, but the yield  
20           was significantly lower than that produced with the control oligo primer.

#### Example 161

- LNA-modified oligonucleotides covalently attached to Separose beads function efficiently in the sequence specific capture of RNA molecules. Three oligos were  
25           synthesised by chemistry (Amy Mueller) for evaluation in poly (rA) binding.

- NH<sub>2</sub>(T8)-T                          Control
- NH<sub>2</sub>(T15)-T                          Control
- NH<sub>2</sub>(LNA-T8)-T                          Test

- 30           200 nmol of each oligo were coupled to 50 mg of prepared CNBr-activated Separose 4B (Pharmacia) per booklet instructions. Unreacted binding sites on the resin were blocked in 100 nM Tris pH 8.0.

Table of Oligo Binding Data

Steps	T9 oligo A <sub>260</sub> units	T16 oligos A <sub>260</sub> units	LNA T9 oligo A <sub>260</sub> units	No oligo Control
Oligo reacted	14.7 (200nM)	26.0 (200 nM)	14.7 (200 nM)	0
Unbound oligo	5.50	10.43	4.20	-
∴ Bound oligo	9.20	15.57	10.50	-
% Bound	62.6%	59.9%	71.4%	-

Oligo bound resins were divided into two portions (~25 mg resin each) for poly (rA) binding analysis in duplicate. Poly (rA) Pharmacia #27-4110-01 (dissolved at 28.2 A<sub>260</sub> 5 units/ml in binding buffer) was used for binding. Five (5) A<sub>260</sub> units were bound to duplicate 25 mg portions of each oligo bound resin per SOP QC 5543. Unbound "breakthrough" poly (rA) was quantitated by A<sub>260</sub> absorbance and used to calculate bound. The fate of the bound poly (rA) was tracked through Low salt buffer wash and several elutions. As shown in Table 10 both the LNA and DNA coated beads function 10 efficiently in the capture of poly (rA) target molecules. The LNA coated beads, however, bind the poly (rA) target much more tightly than the DNA coated beads as evidenced by the poly (rA) elution profiles of the different beads. We conclude that 1) an LNA T9 oligo is efficient in the capture of RNA molecules containing a stretch of A residues and that 2) the captured RNA molecules are bound much more tightly to the 15 LNA T9 oligo beads than to the control DNA T9 and DNA T16 oligo.

## CLAIMS

1. An oligomer (hereinafter termed "LNA modified oligonucleotide") comprising at least one nucleoside analogue (hereinafter termed "LNA") of the general formula I

5

wherein X is selected from -O-, -S-, -N(R<sup>N\*</sup>)-, -C(R<sup>6</sup>R<sup>6\*</sup>)-, -O-C(R<sup>7</sup>R<sup>7\*</sup>)-, -C(R<sup>6</sup>R<sup>6\*</sup>)-O-, -S-C(R<sup>7</sup>R<sup>7\*</sup>)-, -C(R<sup>8</sup>R<sup>8\*</sup>)-S-, -N(R<sup>N\*</sup>)-C(R<sup>7</sup>R<sup>7\*</sup>)-, -C(R<sup>6</sup>R<sup>6\*</sup>)-N(R<sup>N\*</sup>)-, and -C(R<sup>6</sup>R<sup>6\*</sup>)-C(R<sup>7</sup>R<sup>7\*</sup>)-;

B is selected from hydrogen, hydroxy, optionally substituted C<sub>1-4</sub>-alkoxy, optionally 10 substituted C<sub>1-4</sub>-alkyl, optionally substituted C<sub>1-4</sub>-acyloxy, nucleobases, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands;

P designates the radical position for an internucleoside linkage to a succeeding 15 monomer, or a 5'-terminal group, such internucleoside linkage or 5'-terminal group optionally including the substituent R<sup>5</sup>;

one of the substituents R<sup>2</sup>, R<sup>2\*</sup>, R<sup>3</sup>, and R<sup>3\*</sup> is a group P\* which designates an 20 internucleoside linkage to a preceding monomer, or a 3'-terminal group;

one or two pairs of non-geminal substituents selected from the present substituents of R<sup>1\*</sup>, R<sup>4\*</sup>, R<sup>5</sup>, R<sup>5\*</sup>, R<sup>8</sup>, R<sup>6\*</sup>, R<sup>7</sup>, R<sup>7\*</sup>, R<sup>N\*</sup>, and the ones of R<sup>2</sup>, R<sup>2\*</sup>, R<sup>3</sup>, and R<sup>3\*</sup> not 25 designating P\* each designates a biradical consisting of 1-8 groups/atoms selected from -C(R<sup>a</sup>R<sup>b</sup>)-, -C(R<sup>a</sup>)=C(R<sup>a</sup>)-, -C(R<sup>a</sup>)=N-, -O-, -Si(R<sup>a</sup>)<sub>2</sub>-, -S-, -SO<sub>2</sub>-, -N(R<sup>a</sup>)-, and >C=Z,

wherein Z is selected from -O-, -S-, and -N(R<sup>a</sup>)-, and R<sup>a</sup> and R<sup>b</sup> each is 25 independently selected from hydrogen, optionally substituted C<sub>1-12</sub>-alkyl, optionally substituted C<sub>2-12</sub>-alkenyl, optionally substituted C<sub>2-12</sub>-alkynyl, hydroxy, C<sub>1-12</sub>-alkoxy, C<sub>2-12</sub>-alkenyloxy, carboxy, C<sub>1-12</sub>-alkoxycarbonyl, C<sub>1-12</sub>-alkylcarbonyl,

- formyl, aryl, aryloxy-carbonyl, aryloxy, arylcarbonyl, heteroaryl, heteroaryloxy-carbonyl, heteroaryloxy, heteroarylcarbonyl, amino, mono- and di(C<sub>1-6</sub>-alkyl)amino, carbamoyl, mono- and di(C<sub>1-6</sub>-alkyl)-amino-carbonyl, amino-C<sub>1-6</sub>-alkyl-aminocarbonyl, mono- and di(C<sub>1-6</sub>-alkyl)amino-C<sub>1-6</sub>-alkyl-aminocarbonyl,
- 5 C<sub>1-6</sub>-alkyl-carbonylamino, carbamido, C<sub>1-6</sub>-alkanoyloxy, sulphono, C<sub>1-6</sub>-alkylsulphonyloxy, nitro, azido, sulphonyl, C<sub>1-6</sub>-alkylthio, halogen, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, where aryl and heteroaryl may be optionally substituted, and where two geminal substituents R<sup>a</sup> and R<sup>b</sup>
- 10 together may designate optionally substituted methylene (=CH<sub>2</sub>), and wherein two non-geminal or geminal substituents selected from R<sup>a</sup>, R<sup>b</sup>, and any of the substituents R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup>, R<sup>4'</sup>, R<sup>5'</sup>, R<sup>6'</sup> and R<sup>8'</sup>, R<sup>7'</sup>, and R<sup>7''</sup> which are present and not involved in P, P' or the biradical(s) together may form an associated biradical selected from biradicals of the same kind as defined before;
- 15 said pair(s) of non-geminal substituents thereby forming a mono- or bicyclic entity together with (i) the atoms to which said non-geminal substituents are bound and (ii) any intervening atoms; and
- each of the substituents R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup>, R<sup>4'</sup>, R<sup>5'</sup>, R<sup>6'</sup> and R<sup>8'</sup>, R<sup>7'</sup>, and R<sup>7''</sup> which are
- 20 present and not involved in P, P' or the biradical(s), is independently selected from hydrogen, optionally substituted C<sub>1-12</sub>-alkyl, optionally substituted C<sub>2-12</sub>-alkenyl, optionally substituted C<sub>2-12</sub>-alkynyl, hydroxy, C<sub>1-12</sub>-alkoxy, C<sub>2-12</sub>-alkenyloxy, carboxy, C<sub>1-12</sub>-alkoxycarbonyl, C<sub>1-12</sub>-alkylcarbonyl, formyl, aryl, aryloxy-carbonyl, aryloxy, arylcarbonyl, heteroaryl, heteroaryloxy-carbonyl, heteroaryloxy, heteroarylcarbonyl,
- 25 amino, mono- and di(C<sub>1-6</sub>-alkyl)amino, carbamoyl, mono- and di(C<sub>1-6</sub>-alkyl)-amino-carbonyl, amino-C<sub>1-6</sub>-alkyl-aminocarbonyl, mono- and di(C<sub>1-6</sub>-alkyl)amino-C<sub>1-6</sub>-alkyl-aminocarbonyl, C<sub>1-6</sub>-alkyl-carbonylamino, carbamido, C<sub>1-6</sub>-alkanoyloxy, sulphono, C<sub>1-6</sub>-alkylsulphonyloxy, nitro, azido, sulphonyl, C<sub>1-6</sub>-alkylthio, halogen, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups,
- 30 reporter groups, and ligands, where aryl and heteroaryl may be optionally substituted, and where two geminal substituents together may designate oxo, thioxo, imino, or optionally substituted methylene, or together may form a spiro biradical consisting of a 1-5 carbon atom(s) alkylene chain which is optionally interrupted and/or terminated by one or more heteroatoms/groups selected from -O-, -S-, and -(NR<sup>N</sup>)- where R<sup>N</sup> is

selected from hydrogen and C<sub>1-4</sub>-alkyl, and where two adjacent (non-geminal) substituents may designate an additional bond resulting in a double bond; and R<sup>N\*</sup>, when present and not involved in a biradical, is selected from hydrogen and C<sub>1-4</sub>-alkyl;

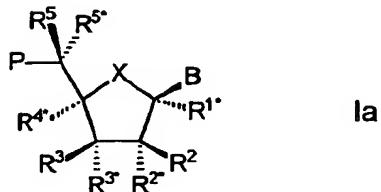

5 and basic salts and acid addition salts thereof;

with the proviso that,

- (i) R<sup>2</sup> and R<sup>3</sup> do not together designate a biradical selected from -O-CH<sub>2</sub>-CH<sub>2</sub>- and -O-CH<sub>2</sub>-CH<sub>2</sub>-CH<sub>2</sub>- when LNA is a bicyclic nucleoside analogue;
  - (ii) R<sup>3</sup> and R<sup>5</sup> do not together designate a biradical selected from -CH<sub>2</sub>-CH<sub>2</sub>-, -O-CH<sub>2</sub>-, when LNA is a bicyclic nucleoside analogue;
  - (iii) R<sup>3</sup>, R<sup>5</sup>, and R<sup>5\*</sup> do not together designate a triradical -CH<sub>2</sub>-CH(-)-CH<sub>2</sub>- when LNA is a tricyclic nucleoside analogue;
  - 15 (iv) R<sup>1\*</sup> and R<sup>6\*</sup> do not together designate a biradical -CH<sub>2</sub>- when LNA is a bicyclic nucleoside analogue; and
  - (v) R<sup>4\*</sup> and R<sup>6\*</sup> do not together designate a biradical -CH<sub>2</sub>- when LNA is a bicyclic nucleoside analogue.
- 20 2. An oligomer according to claim 1, wherein the one or two pairs of non-geminal substituents, constituting one or two biradical(s), respectively, are selected from the present substituents of R<sup>1\*</sup>, R<sup>4\*</sup>, R<sup>6</sup>, R<sup>6\*</sup>, R<sup>7</sup>, R<sup>7\*</sup>, R<sup>N\*</sup>, and the ones of R<sup>2</sup>, R<sup>2\*</sup>, R<sup>3</sup>, and R<sup>3\*</sup> not designating P\*.
- 25 3. An oligomer according to claim 1 or 2, comprising 1-10000 LNA(s) of the general formula I and 0-10000 nucleosides selected from naturally occurring nucleosides and nucleoside analogues, with the proviso that the sum of the number of nucleosides and the number of LNA(s) is at least 2, preferably at least 3, such as in the range of 2-15000.
- 30 4. An oligomer according to claim 3, wherein at least one LNA comprises a nucleobase as the substituent B.

5. An oligomer according to any of the claims 1-4, wherein one of the substituents  $R^3$  and  $R^{3*}$  designates  $P^*$ .

6. An oligomer according to any of the claims 1-5, wherein the LNA(s) has/have the  
5 following formula Ia

wherein P,  $P^*$ , B, X,  $R^1$ ,  $R^2$ ,  $R^{2*}$ ,  $R^3$ ,  $R^{4*}$ ,  $R^5$ , and  $R^{5*}$  are as defined in claims 1-5.

10 7. An oligomer according to claim 6, wherein  $R^{3*}$  designates  $P^*$ .

8. An oligomer according to any of the claims 1-7, comprising one biradical constituted by a pair of (two) non-geminal substituents.

15 9. An oligomer according to any of the claims 1-8, wherein X is selected from - $(CR^6R^{6*})$ -, -O-, -S-, and -N( $R^{N*}$ )-, preferably -O-, -S-, and -N( $R^{N*}$ )-, in particular -O-

10. An oligomer according to any of the claims 1-9, wherein the biradical(s) constituted by pair(s) of non-geminal substituents is/are selected from - $(CR^rR^s)$ -Y-  
20  $(CR^rR^s)_s$ -, - $(CR^rR^s)_s$ -Y- $(CR^rR^s)_s$ -Y-, -Y- $(CR^rR^s)_{r+s}$ -Y-, -Y- $(CR^rR^s)_s$ -Y- $(CR^rR^s)_{r+s}$ -Y-, -Y-Y-, wherein each Y is independently selected from -O-, -S-, -Si( $R^t$ )<sub>2</sub>-, -N( $R^t$ )-, >C=O, -C(=O)-N( $R^t$ )-, and -N( $R^t$ )-C(=O)-, each R' is independently selected from hydrogen, halogen, azido, cyano, nitro, hydroxy, mercapto, amino, mono- or di( $C_{1-6}$ -alkyl)amino, optionally substituted  $C_{1-6}$ -alkoxy, optionally substituted  $C_{1-6}$ -alkyl, DNA  
25 intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and/or two adjacent (non-geminal) R' may together designate a double bond, and each of r and s is 0-4 with the proviso that the sum r+s is 1-5.

11. An oligomer according to claim 10, wherein each biradical is independently selected from  $-Y-$ ,  $-(CR^*R^*)_{r+s-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-Y-$ , wherein and each of  $r$  and  $s$  is 0-3 with the proviso that the sum  $r+s$  is 1-4.

5 12. An oligomer according to claim 11, wherein

- (i)  $R^2^*$  and  $R^4^*$  together designate a biradical selected from  $-Y-$ ,  $-(CR^*R^*)_{r+s+1-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-Y-$ ;
- 10 (ii)  $R^2$  and  $R^3$  together designate a biradical selected from  $-Y-$ ,  $-(CR^*R^*)_{r+s-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-Y-$ ;
- (iii)  $R^2^*$  and  $R^3$  together designate a biradical selected from  $-Y-$ ,  $-(CR^*R^*)_{r+s-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-Y-$ ;
- (iv)  $R^3$  and  $R^4^*$  together designate a biradical selected from  $-Y-$ ,  $-(CR^*R^*)_{r+s-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-Y-$ ;
- 15 (v)  $R^3$  and  $R^5$  together designate a biradical selected from  $-Y'-$ ,  $-(CR^*R^*)_{r+s+1-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-Y-$ ;
- (vi)  $R^1^*$  and  $R^4^*$  together designate a biradical selected from  $-Y'-$ ,  $-(CR^*R^*)_{r+s+1-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-NR^*-$ ; or
- (vii)  $R^1^*$  and  $R^2^*$  together designate a biradical selected from  $-Y-$ ,  $-(CR^*R^*)_{r+s-}$ ,  $-(CR^*R^*)_r-Y-(CR^*R^*)_s-$ , and  $-Y-(CR^*R^*)_{r+s}-Y-$ ;

wherein each of  $r$  and  $s$  is 0-3 with the proviso that the sum  $r+s$  is 1-4, and where  $Y'$  is selected from  $-NR^*-C(=O)-$  and  $-C(=O)-NR^*-$ .

25 13. An oligomer according to claim 12, wherein one of the following criteria applies for at least one LNA:

- (i)  $R^2^*$  and  $R^4^*$  together designate a biradical selected from  $-O-$ ,  $-S-$ ,  $-N(R^*)-$ ,  $-(CR^*R^*)_{r+s+1-}$ ,  $-(CR^*R^*)_r-O-(CR^*R^*)_s-$ ,  $-(CR^*R^*)_r-S-(CR^*R^*)_s-$ ,  $-(CR^*R^*)_r-N(R^*)-(CR^*R^*)_s-$ ,  $-O-(CR^*R^*)_{r+s}-O-$ ,  $-S-(CR^*R^*)_{r+s}-O-$ ,  $-O-(CR^*R^*)_{r+s}-S-$ ,  $-N(R^*)-(CR^*R^*)_{r+s}-S-$ ,  $-N(R^*)-(CR^*R^*)_{r+s}-O-$ ,  $-O-(CR^*R^*)_{r+s}-N(R^*)-$ ,  $-S-(CR^*R^*)_{r+s}-S-$ ,  $-N(R^*)-(CR^*R^*)_{r+s}-N(R^*)-$ ,  $-N(R^*)-(CR^*R^*)_{r+s}-S-$ , and  $-S-(CR^*R^*)_{r+s}-N(R^*)-$ ;
- 30 (ii)  $R^2$  and  $R^3$  together designate a biradical selected from  $-O-$ ,  $-(CR^*R^*)_{r+s-}$ ,  $-(CR^*R^*)_r-O-(CR^*R^*)_s-$ ,  $-(CR^*R^*)_r-S-(CR^*R^*)_s-$ , and  $-(CR^*R^*)_r-N(R^*)-(CR^*R^*)_s-$ ;

- (iii) R<sup>2\*</sup> and R<sup>3</sup> together designate a biradical selected from -O-, -(CR'R')<sub>r+s-</sub>, -(CR'R'),-O-(CR'R')<sub>s-</sub>, -(CR'R'),-S-(CR'R')<sub>s-</sub>, and -(CR'R'),-N(R')-(CR'R')<sub>s-</sub>;
- (iv) R<sup>3</sup> and R<sup>4\*</sup> together designate a biradical selected from -(CR'R'),-O-(CR'R')<sub>s-</sub>, -(CR'R'),-S-(CR'R')<sub>s-</sub>, and -(CR'R'),-N(R')-(CR'R')<sub>s-</sub>;
- 5 (v) R<sup>3</sup> and R<sup>5</sup> together designate a biradical selected from -(CR'R'),-O-(CR'R')<sub>s-</sub>, -(CR'R'),-S-(CR'R')<sub>s-</sub>, and -(CR'R'),-N(R')-(CR'R')<sub>s-</sub>; or
- (vi) R<sup>1\*</sup> and R<sup>4\*</sup> together designate a biradical selected from -(CR'R'),-O-(CR'R')<sub>s-</sub>, -(CR'R'),-S-(CR'R')<sub>s-</sub>, and -(CR'R'),-N(R')-(CR'R')<sub>s-</sub>;
- (vii) R<sup>1\*</sup> and R<sup>2\*</sup> together designate a biradical selected from -(CR'R'),-O-(CR'R')<sub>s-</sub>, -(CR'R'),-S-(CR'R')<sub>s-</sub>, and -(CR'R'),-N(R')-(CR'R')<sub>s-</sub>;

wherein each of r and s is 0-3 with the proviso that the sum r+s is 1-4, and where X is selected from -O-, -S-, and -N(R<sup>H</sup>)- where R<sup>H</sup> designates hydrogen or C<sub>1-4</sub>-alkyl.

15 14. An oligomer according to claim 13, wherein R<sup>3\*</sup> designates P'.

15. An oligomer according to claim 14, wherein R<sup>2\*</sup> and R<sup>4\*</sup> together designate a biradical.

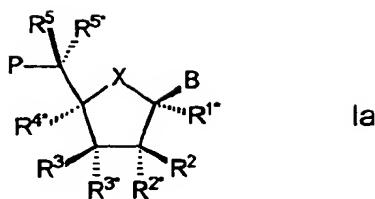

20 16. An oligomer according to claim 15, wherein X is O, R<sup>2</sup> is selected from hydrogen, hydroxy, and optionally substituted C<sub>1-6</sub>-alkoxy, and R<sup>1\*</sup>, R<sup>3</sup>, R<sup>5</sup>, and R<sup>5\*</sup> designate hydrogen.

17. An oligomer according to claim 16, wherein the biradical is selected from -O-, 25 -(CH<sub>2</sub>)<sub>0-1</sub>-O-(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>0-1</sub>-S-(CH<sub>2</sub>)<sub>1-3</sub>-, and -(CH<sub>2</sub>)<sub>0-1</sub>-N(R<sup>N</sup>)-(CH<sub>2</sub>)<sub>1-3</sub>-.

18. An oligomer according to claim 17, wherein the biradical is selected from -O-CH<sub>2</sub>-, -S-CH<sub>2</sub>- and -N(R<sup>N</sup>)-CH<sub>2</sub>-.

30 19 An oligomer according to any of the claims 15-18, wherein B is selected from nucleobases.

20. An oligomer according to claim 19, wherein the oligomer comprises at least one LNA wherein B is selected from adenine and guanine and at least one LNA wherein B is selected from thymine, cytosine and urasil.
- 5 21. An oligomer according to claim 16, wherein the biradical is  $-(CH_2)_{2-4}-$ .
22. An oligomer according to claim 14, wherein R<sup>2</sup> and R<sup>3</sup> together designate a biradical.
- 10 23. An oligomer according to claim 22, wherein X is O, R<sup>2\*</sup> is selected from hydrogen, hydroxy, and optionally substituted C<sub>1-6</sub>-alkoxy, and R<sup>1\*</sup>, R<sup>4\*</sup>, R<sup>5</sup>, and R<sup>6\*</sup> designate hydrogen.
24. An oligomer according to claim 23, wherein the biradical is  $-(CH_2)_{0-1}-O-(CH_2)_{1-3}-$ .
- 15 25. An oligomer according to claim 23, wherein the biradical is  $-(CH_2)_{1-4}-$ .
26. An oligomer according to any of the claims 14-25, wherein one R' is selected from hydrogen, hydroxy, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and any remaining substituents R' are hydrogen.
- 20 27. An oligomer according to any of the claims 14-26, wherein a group R' in the biradical of at least one LNA is selected from DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands.
- 25 28. An oligomer according to any of the claims 14-27, wherein the LNA(s) has/have the general formula Ia.
- 30 29. An oligomer according to claim 1 of the general formula Ia

wherein X is -O-;

- B is selected from nucleobases, DNA intercalators, photochemically active groups,  
5 thermochemically active groups, chelating groups, reporter groups, and ligands;

P designates the radical position for an internucleoside linkage to a succeeding monomer, or a 5'-terminal group, such internucleoside linkage or 5'-terminal group optionally including the substituent R<sup>5</sup>;

- 10 R<sup>3</sup> is a group P\* which designates an internucleoside linkage to a preceding monomer, or a 3'-terminal group;
- R<sup>2</sup> and R<sup>4</sup> together designate a biradical selected from -O-, -S-, -N(R'), -(CR'R')<sub>r+s+1-</sub>,  
15 -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s</sub>, -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s</sub>, -O-(CR'R')<sub>r+s</sub>-O-,  
-S-(CR'R')<sub>r+s</sub>-O-, -O-(CR'R')<sub>r+s</sub>-S-, -N(R')-(CR'R')<sub>r+s</sub>-O-, -O-(CR'R')<sub>r+s</sub>-N(R')-, -S-(CR'R')<sub>r+s</sub>-S-, -N(R')-(CR'R')<sub>r+s</sub>-N(R')-, -N(R')-(CR'R')<sub>r+s</sub>-S-, and -S-(CR'R')<sub>r+s</sub>-N(R')-;  
wherein each R' is independently selected from hydrogen, halogen, azido, cyano, nitro, hydroxy, mercapto, amino, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted  
20 C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and/or two adjacent (non-geminal) R' may together designate a double bond, and each of r and s is 0-3 with the proviso that the sum r+s is 1-4; each of the substituents R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>5</sup>, and R<sup>5</sup>\* is independently selected from hydrogen,  
25 optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, hydroxy, C<sub>1-8</sub>-alkoxy, C<sub>2-6</sub>-alkenyloxy, carboxy, C<sub>1-6</sub>-alkoxycarbonyl, C<sub>1-6</sub>-alkylcarbonyl, formyl, amino, mono- and di(C<sub>1-6</sub>-alkyl)amino, carbamoyl, mono- and di(C<sub>1-6</sub>-alkyl)-amino-carbonyl, C<sub>1-6</sub>-alkyl-carbonylamino, carbamido, azido, C<sub>1-6</sub>-alkanoyloxy, sulphono, sulphanyl, C<sub>1-6</sub>-alkylthio, DNA intercalators, photochemically active groups,

thermochemically active groups, chelating groups, reporter groups, and ligands, and halogen, where two geminal substituents together may designate oxo;

and basic salts and acid addition salts thereof.

5

30. An oligomer according to claim 29, wherein one R<sup>\*</sup> is selected from hydrogen, hydroxy, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and any remaining substituents R<sup>\*</sup> are  
10 hydrogen.

31. An oligomer according to any of the claims 29-30, wherein the biradical is selected from -O-, -(CH<sub>2</sub>)<sub>0-1</sub>-O-(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>0-1</sub>-S-(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>0-1</sub>-N(R<sup>N</sup>)-(CH<sub>2</sub>)<sub>1-3</sub>-, and -(CH<sub>2</sub>)<sub>2-4</sub>-.

15

32. An oligomer according to claim 31, wherein the biradical is selected from -O-CH<sub>2</sub>-, -S-CH<sub>2</sub>- and -N(R<sup>N</sup>)-CH<sub>2</sub>-.

33. An oligomer according to any of the claims 29-32, wherein B is selected from

20 nucleobases.

34. An oligomer according to claim 33, wherein the oligomer comprises at least one LNA wherein B is selected from adenine and guanine and at least one LNA wherein B is selected from thymine, cytosine and urasil.

25

35. An oligomer according to any of the claims 29-34, wherein R<sup>2</sup> is selected from hydrogen, hydroxy and optionally substituted C<sub>1-6</sub>-alkoxy, and R<sup>1\*</sup>, R<sup>3</sup>, R<sup>5</sup>, and R<sup>5\*</sup> designate hydrogen.

30

36. An oligomer according to any of the claims 1-35, wherein any internucleoside linkage of the LNA(s) is selected from linkages consisting of 2 to 4, preferably 3, groups/atoms selected from -CH<sub>2</sub>-, -O-, -S-, -NR<sup>H</sup>-, >C=O, >C=NR<sup>H</sup>, >C=S, -Si(R<sup>H</sup>)<sub>2</sub>-, -SO<sub>2</sub>-, -S(O)<sub>2</sub>-, -P(O)<sub>2</sub>-, -P(O,S)-, -P(S)<sub>2</sub>-, -PO(R'')-, -PO(OCH<sub>3</sub>)-, and -PO(NHR<sup>H</sup>)-,

where R<sup>H</sup> is selected from hydrogen and C<sub>1-4</sub>-alkyl, and R'' is selected from C<sub>1-6</sub>-alkyl and phenyl.

37. An oligomer according to claim 36, wherein any internucleoside linkage of the  
5 LNA(s) is selected from -CH<sub>2</sub>-CH<sub>2</sub>-CH<sub>2</sub>-, -CH<sub>2</sub>-CO-CH<sub>2</sub>-, -CH<sub>2</sub>-CHOH-CH<sub>2</sub>-, -O-CH<sub>2</sub>-O-,

PO(NHR<sup>N</sup>)-O-, where R<sup>H</sup> is selected from hydrogen and C<sub>1-4</sub>-alkyl, and R'' is selected  
from C<sub>1-6</sub>-alkyl and phenyl.
- 25 39. An oligomer according to any of the claims 1-38, wherein each of the substituents  
R<sup>1\*</sup>, R<sup>2</sup>, R<sup>2\*</sup>, R<sup>3</sup>, R<sup>3\*</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>5\*</sup>, R<sup>6</sup>, R<sup>6\*</sup>, R<sup>7</sup>, and R<sup>7\*</sup> of the LNA(s), which are present  
and not involved in P, P\* or the biradical(s), is independently selected from hydrogen,  
optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, hydroxy, C<sub>1-6</sub>-  
alkoxy, C<sub>2-6</sub>-alkenyloxy, carboxy, C<sub>1-6</sub>-alkoxycarbonyl, C<sub>1-6</sub>-alkylcarbonyl, formyl,  
30 amino, mono- and di(C<sub>1-6</sub>-alkyl)amino, carbamoyl, mono- and di(C<sub>1-6</sub>-alkyl)-amino-  
carbonyl, C<sub>1-6</sub>-alkyl-carbonylamino, carbamido, azido, C<sub>1-6</sub>-alkanoyloxy, sulphono,  
sulphanyl, C<sub>1-6</sub>-alkylthio, DNA intercalators, photochemically active groups,  
thermochemically active groups, chelating groups, reporter groups, and ligands, and

halogen, where two geminal substituents together may designate oxo, and where R<sup>N\*</sup>, when present and not involved in a biradical, is selected from hydrogen and C<sub>1-4</sub>-alkyl.

40. An oligomer according to any of the claims 1-39, wherein X is selected from -O-, 5 -S-, and -NR<sup>N\*</sup>-, and each of the substituents R<sup>1\*</sup>, R<sup>2\*</sup>, R<sup>3\*</sup>, R<sup>3\*</sup>, R<sup>4\*</sup>, R<sup>5\*</sup>, R<sup>6\*</sup>, R<sup>7\*</sup>, and R<sup>7\*</sup> of the LNA(s), which are present and not involved in P, P\* or the biradical(s), designate hydrogen.

41. An oligomer according to any of the claims 1-40, wherein P is a 5'-terminal group 10 selected from hydrogen, hydroxy, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkylcarbonyloxy, optionally substituted aryloxy, monophosphate, diphosphate, triphosphate, and -W-A', wherein W is selected from -O-, -S-, and -N(R<sup>H</sup>)- where R<sup>H</sup> is selected from hydrogen and C<sub>1-6</sub>-alkyl, and where A' is selected from DNA intercalators, photochemically active groups, 15 thermochemically active groups, chelating groups, reporter groups, and ligands.

42. An oligomer according to any of the claims 1-41, wherein P\* is a 3'-terminal group selected from hydrogen, hydroxy, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkylcarbonyloxy, optionally substituted aryloxy, and -W-A', wherein 20 W is selected from -O-, -S-, and -N(R<sup>H</sup>)- where R<sup>H</sup> is selected from hydrogen and C<sub>1-6</sub>-alkyl, and where A' is selected from DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands.

43. An oligomer according to any of the claims 1-42, having the following formula V:  
25

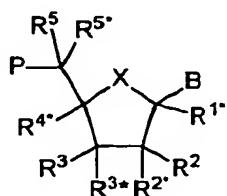

wherein

q is 1-50;

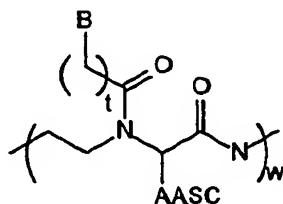

30 each of n(0), ..., n(q) is independently 0-10000;  
each of m(1), ..., m(q) is independently 1-10000;  
with the proviso that the sum of n(0), ..., n(q) and m(1), ..., m(q) is 2-15000;  
G designates a 5'-terminal group;

- each Nu independently designates a nucleoside selected from naturally occurring nucleosides and nucleoside analogues;
- each LNA independently designates a nucleoside analogue;
- each L independently designates an internucleoside linkage between two groups
- 5 selected from Nu and LNA, or L together with G\* designates a 3'-terminal group; and
- each LNA-L independently designates a nucleoside analogue of the general formula I:

wherein the substituents B, P, P', R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup>, R<sup>4'</sup>, R<sup>5'</sup>, and X are as  
10 defined in claims 1-42.

44. An oligomer according to any of the claims 1-42, further comprising a PNA mono- or oligomer segment of the formula

15 wherein B is as defined above for the formula I, AASC designates hydrogen or an amino acid side chain, t is 1-5, and w is 1-50.

45. An oligomer according to any of the claims 1-44, which has an increased specificity towards complementary ssRNA or ssDNA compared to the native  
20 oligonucleotide.

46. An oligomer according to any of the claims 1-44, which has an increased affinity towards complementary ssRNA or ssDNA compared to the native oligonucleotide.

47. An oligomer according to any of the claims 1-44, which is capable of binding to a target sequence in a dsDNA or dsRNA molecule by way of "strand displacement" or by triple helix formation.
- 5 48. An oligomer according to any of the claims 1-44, which is more resistant to nucleases than the native oligonucleotide.
49. An oligomer according to any of the claims 1-44, which has nucleic acid catalytic activity (LNA modified ribozymes).
- 10 50. An oligomer comprising at least one nucleoside analogue which imparts to the oligomer a  $T_m$  with a complementary DNA oligonucleotide which is at least 2.5 °C higher than that of the corresponding unmodified reference oligonucleotide which does not comprise any nucleoside analogue.
- 15 51. An oligomer according to claim 50, wherein the  $T_m$  is at least  $2.5 \times N$  °C higher, where N is the number of nucleoside analogues.
52. An oligomer comprising at least one nucleoside analogue which imparts to the  
20 oligomer a  $T_m$  with a complementary RNA oligonucleotide which is at least 4.0 °C higher than that of the corresponding unmodified reference oligonucleotide which does not comprise any nucleoside analogue.
- 25 53. An oligomer according to claim 52, wherein the  $T_m$  is at least  $4.0 \times N$  °C higher, where N is the number of nucleoside analogues.
54. An oligomer according to claim 50 or 52, wherein the oligomer is as defined in any of the claims 1-49, where the at least one nucleoside analogue has the formula I where B is a nucleobase.
- 30 55. An oligomer according to claim 50, wherein said oligomer, when hybridised with a partially complementary DNA oligonucleotide having one or more mismatches with said oligomer, exhibits a reduction in  $T_m$ , as a result of said mismatches, which is equal to or greater than the reduction which would be observed with the

corresponding unmodified reference oligonucleotide which does not comprise any nucleoside analogues.

56. An oligomer according to claim 52, wherein said oligomer, when hybridised with a  
5 partially complementary RNA oligonucleotide having one or more mismatches with  
said oligomer, exhibits a reduction in  $T_m$ , as a result of said mismatches, which is  
equal to or greater than the reduction which would be observed with the  
corresponding unmodified reference oligonucleotide which does not comprise any  
nucleoside analogues.

10

57. An oligomer according to claim 50 or 52, which has substantially the same  
sensitivity of  $T_m$  to the ionic strength of the hybridisation buffer as that of the  
corresponding unmodified reference oligonucleotide.

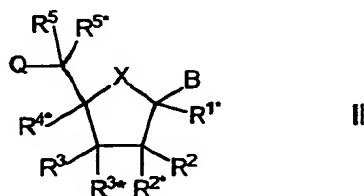

15

58. An oligomer according to claim 50 or 52, which is at least 30% modified.

59. An oligomer according to claim 50 or 52, which has substantially higher 3'-  
exonuclease stability than the corresponding unmodified reference oligonucleotide.

20

60. A nucleoside analogue (hereinafter LNA) of the general formula II

wherein the substituent B is selected from nucleobases, DNA intercalators,  
photochemically active groups, thermochemically active groups, chelating groups,  
reporter groups, and ligands;

25

X is selected from -O-, -S-, -N(R<sup>N+</sup>)-, and -C(R<sup>6</sup>R<sup>6</sup>)-;

one of the substituents R<sup>2</sup>, R<sup>2'</sup>, R<sup>3</sup>, and R<sup>3'</sup> is a group Q<sup>+</sup>;

- each of Q and Q' is independently selected from hydrogen, azido, halogen, cyano, nitro, hydroxy, Prot-O-, Act-O-, mercapto, Prot-S-, Act-S-, C<sub>1-6</sub>-alkylthio, amino, Prot-N(R<sup>H</sup>)-, Act-N(R<sup>H</sup>)-, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyl, optionally substituted C<sub>2-6</sub>-alkynyloxy, monophosphate, diphosphate, triphosphate, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, ligands, carboxy, sulphono, hydroxymethyl, Prot-O-CH<sub>2</sub>-, Act-O-CH<sub>2</sub>-, aminomethyl, Prot-N(R<sup>H</sup>)-CH<sub>2</sub>-, Act-N(R<sup>H</sup>)-CH<sub>2</sub>-, carboxymethyl, sulphonomethyl, where
- Prot is a protection group for -OH, -SH, and -NH(R<sup>H</sup>), respectively, Act is an activation group for -OH, -SH, and -NH(R<sup>H</sup>), respectively, and R<sup>H</sup> is selected from hydrogen and C<sub>1-6</sub>-alkyl;
- (i) R<sup>2\*</sup> and R<sup>4\*</sup> together designate a biradical selected from -O-, -(CR'R')<sub>r+s+1-</sub>, -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s-</sub>, -O-(CR'R')<sub>r+s</sub>-O-, -S-(CR'R')<sub>r+s</sub>-O-, -O-(CR'R')<sub>r+s</sub>-S-, -N(R')-(CR'R')<sub>r+s</sub>-O-, -O-(CR'R')<sub>r+s</sub>-N(R')-, -S-(CR'R')<sub>r+s</sub>-S-, -N(R')-(CR'R')<sub>r+s</sub>-S-, and -S-(CR'R')<sub>r+s</sub>-N(R')-;
- (ii) R<sup>2</sup> and R<sup>3</sup> together designate a biradical selected from -O-, -(CR'R')<sub>r+s-</sub>, -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s-</sub>, and -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s-</sub>;
- (iii) R<sup>2\*</sup> and R<sup>3</sup> together designate a biradical selected from -O-, -(CR'R')<sub>r+s-</sub>, -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s-</sub>, and -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s-</sub>;
- (iv) R<sup>3</sup> and R<sup>4\*</sup> together designate a biradical selected from -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s-</sub>, and -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s-</sub>;
- (v) R<sup>3</sup> and R<sup>5</sup> together designate a biradical selected from -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s-</sub>, and -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s-</sub>; or
- (vi) R<sup>1\*\*</sup> and R<sup>4\*</sup> together designate a biradical selected from -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s-</sub>, and -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s-</sub>;
- (vii) R<sup>1\*\*</sup> and R<sup>2\*</sup> together designate a biradical selected from -(CR'R')<sub>r</sub>-O-(CR'R')<sub>s-</sub>, -(CR'R')<sub>r</sub>-S-(CR'R')<sub>s-</sub>, and -(CR'R')<sub>r</sub>-N(R')-(CR'R')<sub>s-</sub>;
- wherein each R' is independently selected from hydrogen, halogen, azido, cyano, nitro, hydroxy, mercapto, amino, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, DNA intercalators,

photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and/or two adjacent (non-geminal) R<sup>1</sup> may together designate a double bond, and each of r and s is 0-3 with the proviso that the sum r+s is 1-4;

5

each of the substituents R<sup>1+</sup>, R<sup>2</sup>, R<sup>2+</sup>, R<sup>3</sup>, R<sup>4+</sup>, R<sup>5</sup>, and R<sup>5+</sup>, which are not involved in Q,

Q' or the biradical, is independently selected from hydrogen, optionally substituted

C<sub>1-12</sub>-alkyl, optionally substituted C<sub>2-12</sub>-alkenyl, optionally substituted C<sub>2-12</sub>-alkynyl,

hydroxy, C<sub>1-12</sub>-alkoxy, C<sub>2-12</sub>-alkenyloxy, carboxy, C<sub>1-12</sub>-alkoxycarbonyl, C<sub>1-12</sub>-

10 alkylcarbonyl, formyl, aryl, aryloxy-carbonyl, aryloxy, arylcarbonyl, heteroaryl, heteroaryloxy-carbonyl, heteroaryloxy, heteroarylcarbonyl, amino, mono- and di(C<sub>1-6</sub>-alkyl)amino, carbamoyl, mono- and di(C<sub>1-6</sub>-alkyl)-amino-carbonyl, amino-C<sub>1-6</sub>-alkyl-aminocarbonyl, mono- and di(C<sub>1-6</sub>-alkyl)amino-C<sub>1-6</sub>-alkyl-aminocarbonyl, C<sub>1-6</sub>-alkyl-carbonylamino, carbamido, C<sub>1-6</sub>-alkanoyloxy, sulphono, C<sub>1-6</sub>-alkylsulphonyloxy, nitro,

15 azido, sulphanyl, C<sub>1-6</sub>-alkylthio, halogen, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, where aryl and heteroaryl may be optionally substituted, and where two geminal substituents together may designate oxo, thioxo, imino, or optionally substituted methylene, or together may form a spiro biradical consisting of a 1-5

20 carbon atom(s) alkylene chain which is optionally interrupted and/or terminated by one or more heteroatoms/groups selected from -O-, -S-, and -(NR<sup>N</sup>)- where R<sup>N</sup> is selected from hydrogen and C<sub>1-4</sub>-alkyl, and where two adjacent (non-geminal) substituents may designate an additional bond resulting in a double bond; and R<sup>N+</sup>, when present and not involved in a biradical, is selected from hydrogen and C<sub>1-4</sub>-alkyl;

25

and basic salts and acid addition salts thereof;

with the first proviso that,

- 30 (i) R<sup>2</sup> and R<sup>3</sup> do not together designate a biradical selected from -O-CH<sub>2</sub>-CH<sub>2</sub>- and -O-CH<sub>2</sub>-CH<sub>2</sub>-CH<sub>2</sub>; and  
(ii) R<sup>3</sup> and R<sup>5</sup> do not together designate a biradical selected from -CH<sub>2</sub>-CH<sub>2</sub>-, -O-CH<sub>2</sub>-, and -O-Si(iPr)<sub>2</sub>-O-Si(iPr)<sub>2</sub>-O-;

and with the second proviso that any chemical group (including any nucleobase), which is reactive under the conditions prevailing in oligonucleotide synthesis, is optionally functional group protected.

5 61. A nucleoside analogue according to claim 60, wherein the group B is selected from nucleobases and functional group protected nucleobases.

62. A nucleoside analogue according to any of the claims 60-61, wherein X is selected from -O-, -S-, and -N(R<sup>N\*</sup>)-.

10

63. A nucleoside analogue according to any of the claims 60-62, wherein each of the substituents R<sup>1\*</sup>, R<sup>2</sup>, R<sup>2\*</sup>, R<sup>3</sup>, R<sup>3\*</sup>, R<sup>4\*</sup>, R<sup>5</sup>, and R<sup>5\*</sup>, which are present and not involved in Q, Q' or the biradical, is independently selected from hydrogen, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, hydroxy, C<sub>1-6</sub>-alkoxy, C<sub>2-6</sub>-alkenyloxy, carboxy, C<sub>1-6</sub>-alkoxycarbonyl, C<sub>1-6</sub>-alkylcarbonyl, formyl, amino, mono- and di(C<sub>1-6</sub>-alkyl)amino, carbamoyl, mono- and di(C<sub>1-6</sub>-alkyl)-amino-carbonyl, C<sub>1-6</sub>-alkyl-carbonylamino, carbamido, azido, C<sub>1-6</sub>-alkanoyloxy, sulphono, sulphanyl, C<sub>1-6</sub>-alkylthio,

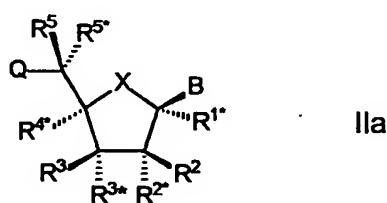

15 DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, ligands, and halogen, where two geminal substituents together may designate oxo, and where R<sup>N\*</sup>, when present and not involved in a biradical, is selected from hydrogen and C<sub>1-4</sub>-alkyl, with the proviso that any hydroxy, amino, mono(C<sub>1-6</sub>-alkyl)amino, sulfanyl, and carboxy is optionally protected.

20 64. A nucleotide analogue according to any of the claims 60-63, each of the substituents R<sup>1\*</sup>, R<sup>2</sup>, R<sup>2\*</sup>, R<sup>3</sup>, R<sup>3\*</sup>, R<sup>4\*</sup>, and R<sup>5</sup>, R<sup>5\*</sup>, R<sup>6</sup>, R<sup>6\*</sup>, which are present and not involved in Q' or the biradical, designate hydrogen.

25 65. A nucleoside analogue according to any of the claims 60-64, wherein R<sup>3\*</sup> 30 designates P'.

66. A nucleoside analogue according to any of the claims 60-65, wherein Q is independently selected from hydrogen, azido, halogen, cyano, nitro, hydroxy, Prot-O-, mercapto, Prot-S-, C<sub>1-6</sub>-alkylthio, amino, Prot-N(R<sup>H</sup>)-, mono- or di(C<sub>1-6</sub>-alkyl)amino,

- optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyl, optionally substituted C<sub>2-6</sub>-alkynyloxy, monophosphate, diphosphate, triphosphate, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, ligands, carboxy, sulphono, hydroxymethyl, Prot-O-CH<sub>2</sub>-, aminomethyl, Prot-N(R<sup>H</sup>)-CH<sub>2</sub>-, carboxymethyl, sulphonomethyl, where Prot is a protection group for -OH, -SH, and -NH(R<sup>H</sup>), respectively, and R<sup>H</sup> is selected from hydrogen and C<sub>1-6</sub>-alkyl; and
- 10 Q' is selected from hydrogen, azido, halogen, cyano, nitro, hydroxy, Act-O-, mercapto, Act-S-, C<sub>1-6</sub>-alkylthio, amino, Act-N(R<sup>H</sup>)-, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyl, optionally substituted C<sub>2-6</sub>-alkynyloxy, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, ligands, carboxy, sulphono, where Act is an activation group for -OH, -SH, and -NH(R<sup>H</sup>), respectively, and R<sup>H</sup> is selected from hydrogen and C<sub>1-6</sub>-alkyl.
- 15 67. A nucleotide analogue according to any of the claims 60-66, having the general formula IIa

wherein the substituents Q, B, R<sup>1\*</sup>, R<sup>2</sup>, R<sup>2\*</sup>, R<sup>3</sup>, R<sup>3\*</sup>, R<sup>4\*</sup>, R<sup>5</sup>, and R<sup>5\*</sup> are as defined in claims 60-66.

25

68. A nucleoside analogue according to claim 67, wherein R<sup>3\*</sup> designates P'.

69. A nucleoside analogue according to claim 68, wherein R<sup>2\*</sup> and R<sup>4\*</sup> together designate a biradical.

30

70. A nucleoside analogue according to claim 69, wherein X is O, R<sup>2</sup> selected from hydrogen, hydroxy, and optionally substituted C<sub>1-6</sub>-alkoxy, and R<sup>1\*</sup>, R<sup>3</sup>, R<sup>5</sup>, and R<sup>5\*</sup> designate hydrogen.

5 71. A nucleoside analogue according to claim 70, wherein the biradical is selected from -O-, -(CH<sub>2</sub>)<sub>0-1</sub>-O-(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>0-1</sub>-S-(CH<sub>2</sub>)<sub>1-3</sub>-, and -(CH<sub>2</sub>)<sub>0-1</sub>-N(R<sup>N</sup>)-(CH<sub>2</sub>)<sub>1-3</sub>-.

72. A nucleoside analogue according to claim 71, wherein the biradical is selected from -O-CH<sub>2</sub>-, -S-CH<sub>2</sub>- and -N(R<sup>N</sup>)-CH<sub>2</sub>-.

10

73. A nucleoside analogue according to any of the claims 69-72, wherein B is selected from nucleobases.

15 74. A nucleoside analogue according to claim 73, wherein the oligomer comprises at least one LNA wherein B is selected from adenine and guanine and at least one LNA wherein B is selected from thymine, cytosine and urasil.

75. A nucleoside analogue according to claim 70, wherein the biradical is -(CH<sub>2</sub>)<sub>2-4</sub>-, preferably -(CH<sub>2</sub>)<sub>2</sub>-.

20

76. A nucleoside analogue according to claim 68, wherein R<sup>2</sup> and R<sup>3</sup> together designate a biradical.

25 77. A nucleoside analogue according to claim 76, wherein X is O, R<sup>2\*</sup> is selected from hydrogen, hydroxy, and optionally substituted C<sub>1-6</sub>-alkoxy, and R<sup>1\*</sup>, R<sup>4\*</sup>, R<sup>6</sup>, and R<sup>5\*</sup> designate hydrogen.

78. A nucleoside analogue according to claim 77, wherein the biradical is -(CH<sub>2</sub>)<sub>0-1</sub>-O-(CH<sub>2</sub>)<sub>1-3</sub>-.

30

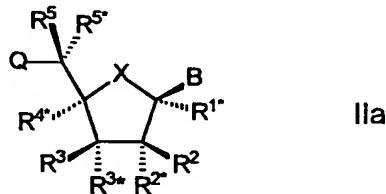

79. A nucleoside analogue according to claim 77, wherein the biradical is -(CH<sub>2</sub>)<sub>1-4</sub>-.

80. A nucleoside analogue according to any of the claims 68-79, wherein one R' is selected from hydrogen, hydroxy, optionally substituted C<sub>1-6</sub>-alkoxy, optionally

substituted C<sub>1-6</sub>-alkyl, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and any remaining substituents R' are hydrogen.

- 5 81. A nucleoside analogue according to any of the claims 68-80, wherein a group R' in the biradical of at least one LNA is selected from DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands.
- 10 82. A nucleoside analogue according to any of the claims 68-81, wherein the LNA(s) has/have the general formula Ia.

83. A nucleoside analogue according to claim 60 of the general formula IIa

15 wherein X is -O-;

B is selected from nucleobases, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands;

20 R<sup>3\*</sup> is a group Q\*;

each of Q and Q\* is independently selected from hydrogen, azido, halogen, cyano, nitro, hydroxy, Prot-O-, Act-O-, mercapto, Prot-S-, Act-S-, C<sub>1-6</sub>-alkylthio, amino, Prot-N(R<sup>H</sup>)-, Act-N(R<sup>H</sup>)-, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy,

- 25 optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyl, optionally substituted C<sub>2-6</sub>-alkynyloxy, monophosphate, diphosphate, triphosphate, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, ligands, carboxy, sulphono, hydroxymethyl, Prot-O-CH<sub>2</sub>-, Act-O-CH<sub>2</sub>-,  
30 aminomethyl, Prot-N(R<sup>H</sup>)-CH<sub>2</sub>-, Act-N(R<sup>H</sup>)-CH<sub>2</sub>-, carboxymethyl, sulphonomethyl, where

Prot is a protection group for -OH, -SH, and -NH(R<sup>H</sup>), respectively, Act is an activation group for -OH, -SH, and -NH(R<sup>H</sup>), respectively, and R<sup>H</sup> is selected from hydrogen and C<sub>1-6</sub>-alkyl;

- 5 R<sup>2\*</sup> and R<sup>4\*</sup> together designate a biradical selected from -O-, -S-, -N(R<sup>\*</sup>)-, -(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s+1-</sub>, -(CR<sup>\*</sup>R<sup>\*</sup>),-O-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>s-</sub>, -(CR<sup>\*</sup>R<sup>\*</sup>),-S-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>s-</sub>, -(CR<sup>\*</sup>R<sup>\*</sup>),-N(R<sup>\*</sup>)-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>s-</sub>, -O-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>O-, -S-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>O-, -O-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>S-, -N(R<sup>\*</sup>)-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>O-, -O-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>N(R<sup>\*</sup>)-, -S-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>S-, -N(R<sup>\*</sup>)-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>N(R<sup>\*</sup>)-, -N(R<sup>\*</sup>)-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>S-, and -S-(CR<sup>\*</sup>R<sup>\*</sup>)<sub>r+s-</sub>N(R<sup>\*</sup>)-; wherein each R<sup>\*</sup> is independently selected from hydrogen, halogen, azido, cyano,
- 10 nitro, hydroxy, mercapto, amino, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and/or two adjacent (non-geminal) R<sup>\*</sup> may together designate a double bond, and each of r and s is 0-3 with the proviso that the sum r+s is 1-4;
- 15 each of the substituents R<sup>1\*</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>5</sup>, and R<sup>6\*</sup> is independently selected from hydrogen, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, hydroxy, C<sub>1-6</sub>-alkoxy, C<sub>2-6</sub>-alkenyloxy, carboxy, C<sub>1-6</sub>-alkoxycarbonyl, C<sub>1-6</sub>-alkylcarbonyl, formyl, amino, mono- and di(C<sub>1-6</sub>-alkyl)amino, carbamoyl, mono- and di(C<sub>1-6</sub>-alkyl)-amino-
- 20 carbonyl, C<sub>1-6</sub>-alkyl-carbonylamino, carbamido, azido, C<sub>1-6</sub>-alkanoyloxy, sulphono, sulphanyl, C<sub>1-6</sub>-alkylthio, DNA intercalators, photochemically active groups, thermochemically active groups, chelating groups, reporter groups, and ligands, and halogen, where two geminal substituents together may designate oxo;
- 25 and basic salts and acid addition salts thereof;
- and with the proviso that any chemical group (including any nucleobase), which is reactive under the conditions prevailing in oligonucleotide synthesis, is optionally functional group protected.
- 30 84. A nucleotide analogue according to claim 83, wherein one R<sup>\*</sup> is selected from hydrogen, hydroxy, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, DNA intercalators, photochemically active groups, thermochemically active groups,

chelating groups, reporter groups, and ligands, and any remaining substituents R<sup>+</sup> are hydrogen.

85. A nucleotide analogue according to any of the claims 83-84, wherein the biradical 5 is selected from -O-, -(CH<sub>2</sub>)<sub>0-1</sub>-O-(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>0-1</sub>-S-(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>0-1</sub>-N(R<sup>N</sup>)-(CH<sub>2</sub>)<sub>1-3</sub>-, and -(CH<sub>2</sub>)<sub>2-4</sub>-.

86. A nucleoside analogue according to claim 85, wherein the biradical is selected from -O-CH<sub>2</sub>-, -S-CH<sub>2</sub>- and -N(R<sup>N</sup>)-CH<sub>2</sub>-.

10

87. A nucleoside analogue according to any of the claims 83-86, wherein B is selected from nucleobases.

88. A nucleoside analogue according to claim 87, wherein the oligomer comprises at 15 least one LNA wherein B is selected from adenine and guanine and at least one LNA wherein B is selected from thymine, cytosine and urasil.

89. A nucleoside analogue according to claim 83, wherein B designates a nucleobase, X is -O-, R<sup>2+</sup> and R<sup>4+</sup> together designate a biradical selected from -(CH<sub>2</sub>)<sub>0-1</sub>-O-(CH<sub>2</sub>)<sub>1-3</sub>-, 20 -(CH<sub>2</sub>)<sub>0-1</sub>-S-(CH<sub>2</sub>)<sub>1-3</sub>-, and -(CH<sub>2</sub>)<sub>0-1</sub>-N(R<sup>N</sup>)-(CH<sub>2</sub>)<sub>1-3</sub>- where R<sup>N</sup> is selected from hydrogen and C<sub>1-4</sub>-alkyl, Q designates Prot-O-, R<sup>3+</sup> is Q<sup>+</sup> which designates Act-OH, and R<sup>1+</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>5</sup>, and R<sup>6+</sup> each designate hydrogen, wherein Act and Prot are as defined in claim 58.

25 90. A nucleoside analogue according to claim 83, wherein B designates a nucleobase, X is -O-, R<sup>2+</sup> and R<sup>4+</sup> together designate a biradical selected from -(CH<sub>2</sub>)<sub>0-1</sub>-O-(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>0-1</sub>-S-(CH<sub>2</sub>)<sub>1-3</sub>-, and -(CH<sub>2</sub>)<sub>0-1</sub>-N(R<sup>N</sup>)-(CH<sub>2</sub>)<sub>1-3</sub>- where R<sup>N</sup> is selected from hydrogen and C<sub>1-4</sub>-alkyl, Q is selected from hydroxy, mercapto, C<sub>1-6</sub>-alkylthio, amino, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyoxy, monophosphate, diphosphate, and triphosphate, R<sup>3+</sup> is Q<sup>+</sup> which is selected from hydrogen, azido, halogen, cyano, nitro, hydroxy, mercapto, C<sub>1-6</sub>-alkylthio, amino, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyl, and

optionally substituted C<sub>2-6</sub>-alkynyoxy, R<sup>3</sup> is selected from hydrogen, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, and optionally substituted C<sub>2-6</sub>-alkynyl, and R<sup>1\*</sup>, R<sup>2</sup>, R<sup>5</sup>, and R<sup>5\*</sup> each designate hydrogen.

- 5 91. A nucleoside analogue according to claim 83, wherein B designates a nucleobase, X is -O-, R<sup>2</sup> and R<sup>3</sup> together designate a biradical selected from -(CH<sub>2</sub>)<sub>0-1</sub>-O-CH=CH-, -(CH<sub>2</sub>)<sub>0-1</sub>-S-CH=CH-, and -(CH<sub>2</sub>)<sub>0-1</sub>-N(R<sup>N</sup>)-CH=CH- where R<sup>N</sup> is selected from hydrogen and C<sub>1-4</sub>-alkyl, Q is selected from hydroxy, mercapto, C<sub>1-6</sub>-alkylthio, amino, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyoxy, monophosphate, diphosphate, and triphosphate, R<sup>3\*</sup> is Q\* which is selected from hydrogen, azido, halogen, cyano, nitro, hydroxy, mercapto, C<sub>1-6</sub>-alkylthio, amino, mono- or di(C<sub>1-6</sub>-alkyl)amino, optionally substituted C<sub>1-6</sub>-alkoxy, optionally substituted C<sub>1-6</sub>-alkyl, optionally substituted C<sub>2-6</sub>-alkenyl, optionally substituted C<sub>2-6</sub>-alkenyloxy, optionally substituted C<sub>2-6</sub>-alkynyl, and
- 10 15 optionally substituted C<sub>2-6</sub>-alkynyoxy, and R<sup>1\*</sup>, R<sup>2\*</sup>, R<sup>4\*</sup>, R<sup>5</sup>, and R<sup>5\*</sup> each designate hydrogen.
92. A nucleoside analogue according to claim 60, which is selected from (1R,3R,4R,7S)-7-(2-cyanoethoxy(diisopropylamino)phosphinoxy)-1-(4,4'-dimethoxytrityloxymethyl)-3-(thymin-1-yl)-2,5-dioxabicyclo[2.2.1]heptane,
- 20 (1R,3R,4R,7S)-7-hydroxy-1-(4,4'-dimethoxytrityloxymethyl)-3-(thymin-1-yl)-2,5-dioxabicyclo[2.2.1]heptane-7-O-(2-chlorophenylphosphate), and (1R,3R,4R,7S)-7-hydroxy-1-(4,4'-dimethoxytrityloxymethyl)-3-(thymin-1-yl)-2,5-dioxabicyclo[2.2.1]heptane-7-O-(H-phosphonate) and the 3-(cytosin-1-yl), 3-(urasil-1-yl), 3-(adenin-1-yl) and 3-(guanin-1-yl) analogues thereof
- 25 93. The use of an LNA as defined in any of the claims 60-92 for the preparation of an LNA modified oligonucleotide (an oligomer) according to any of the claims 1-59.
- 30 94. The use according to claim 93, wherein the LNA modified oligonucleotide comprises normal nucleosides, such as ribonucleosides and/or dioxyribonucleosides, as well as modified nucleosides different from those defined in claim 60.

95. The use according to claim 93, wherein the incorporation of LNA modulates the ability of the oligonucleotide to act as a substrate for nucleic acid active enzymes.

96. The use of an LNA as defined in any of the claims 60-92 for the preparation of a  
5 conjugate of an LNA modified oligonucleotide and a compound selected from proteins,  
amplicons, enzymes, polysaccharides, antibodies, haptens, peptides, and PNA.

97. A conjugate of an LNA modified oligonucleotide (an oligomer) as defined in any of  
the claims 1-59 and a compound selected from proteins, amplicons, enzymes,  
10 polysaccharides, antibodies, haptens, peptides, and PNA.

98. The use of an LNA as defined in any of the claims 60-92 as a substrate for  
enzymes active on nucleic acids.

15

99. The use according to claim 98, wherein the substituent Q in the formula I in claim  
60 designates a triphosphate,

100. The use according to claim 98, wherein the LNA is used as a substrate for DNA  
20 and RNA polymerases.

101. The use of an LNA as defined in any of the claims 60-92 as a therapeutic agent.

102. The use of an LNA as defined in any of the claims 60-92 for diagnostic  
25 purposes.

103. A solid support material having immobilised thereto an optionally nucleobase  
protected and optionally 5'-OH protected LNA.

30 104. The use of one or more LNA as defined in any of the claims 60-92 in the  
construction of solid surface onto which LNA modified oligonucleotides of different  
sequences are attached .

105. The use according to claim 113, wherein the LNA modified oligonucleotides are attached in a predetermined pattern.

106. The use according to claim 113, wherein the LNAs are used to equalise the  $T_m$  of  
5 the corresponding unmodified reference oligonucleotides.

107. The use according to claim 113, wherein the LNA modified oligonucleotides have an increased affinity toward complementary ssDNA or ssRNA compared to native oligonucleotide.

10

108. The use according to claim 113, wherein the LNA modified oligonucleotides have an increased specificity toward complementary ssDNA or ssRNA compared to native oligonucleotide.

15 109. The use of LNA modified oligomers (ribozymes) as defined in any of the claims 1-59 in the sequence specific cleavage of target nucleic acids.

110. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 in therapy, e.g. as an antisense, antigene or gene activating

20 therapeutic.

111. The use according to claim 110, wherein the LNA modified oligonucleotide recruits RNaseH.

25 112. The use of complexes of more than one LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 in therapy, e.g. as an antisense, antigene or gene activating therapeutic.

113. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of  
30 the claims 1-59 as an aptamer in therapeutic applications.

114. The use according to claim 119, wherein the LNA modified oligonucleotide comprises at least one internucleoside linkage not being a phosphate diester linkage.

115. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 in diagnostics, e.g. for the isolation, purification, amplification, detection, identification, quantification, or capture of natural or synthetic nucleic acids.

5

116. The use according to claim 115, wherein the oligonucleotide comprises a photochemically active group, a thermochemically active group, a chelating group, a reporter group, or a ligand that facilitates the direct or indirect detection of the oligonucleotide or the immobilisation of the oligonucleotide onto a solid support.

10

117. The use according to claim 116, wherein the photochemically active group, the thermochemically active group, the chelating group, the reporter group, or the ligand includes a spacer (K), said spacer comprising a chemically cleavable group.

15

118. The use according to claim 116, wherein the photochemically active group, the thermochemically active group, the chelating group, the reporter group, or the ligand is attached via the biradical (i.e. as R') of at least one of the LNA(s) of the oligonucleotide.

20

119. The use according to claim 115 for capture and detection of naturally occurring or synthetic double stranded or single stranded nucleic acids such as RNA or DNA.

120. The use according to claim 115 for purification of naturally occurring double stranded or single stranded nucleic acids such as RNA or DNA.

25

121. The use according to claim 115 as a probe in in-situ hybridisation, in Southern hybridisation, Dot blot hybridisation, reverse Dot blot hybridisation, or in Northern hybridisation.

30

122. The use according to claim 115 in the construction of an affinity pair.

123. The use according to claim 115 as a primer in a nucleic acid sequencing reaction or primer extension reactions.

124. The use according to claim 115 as a primer in a nucleic acid amplification reaction.
  125. The use according to claim 124, wherein the primer is so adapted that the amplification reaction is an essentially linear reaction.
  126. The use according to claim 124, wherein the primer is so adapted that the amplification reaction is an essentially exponential reaction.
- 10 127. The use according to any of the claims 124-126, wherein the nucleic acid amplification reaction results in a double stranded DNA product comprising at least one single stranded end.
128. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of  
15 the claims 1-59 as an aptamer in molecular diagnostics.
129. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 as an aptamer in RNA mediated catalytic processes.
- 20 130. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 as an aptamer in specific binding of antibiotics, drugs, amino acids, peptides, structural proteins, protein receptors, protein enzymes, saccharides, polysaccharides, biological cofactors, nucleic acids, or triphosphates.
- 25 131. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 as an aptamer in the separation of enantiomers from racemic mixtures by stereospecific binding.
132. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of  
30 the claims 1-59 for the labelling of cells.
133. The use according to claim 132, wherein the label allows the cells to be separated from unlabelled cells.

134. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 to hybridise to non-protein coding cellular RNAs, such as tRNA, rRNA, snRNA and scRNA, *in vivo* or *in-vitro*.

5 135. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 in the construction of an oligonucleotide containing a fluorophor and a quencher, positioned in such a way that the hybridised state of the oligonucleotide can be distinguished from the unbound state of the oligonucleotide by an increase in the fluorescent signal from the probe.

10

136. The use of an LNA modified oligonucleotide (an oligomer) as defined in any of the claims 1-59 in the construction of Taqman probes or Molecular Beacons.

137. A kit for the isolation, purification, amplification, detection, identification,  
15 quantification, or capture of natural or synthetic nucleic acids, the kit comprising a reaction body and one or more LNA modified oligonucleotides (oligomer) as defined in any of the claims 1-59.

138. A kit according to claim 137, wherein the LNA modified oligonucleotides are  
20 immobilised onto said reactions body.

139. A kit for the isolation, purification, amplification, detection, identification, quantification, or capture of natural or synthetic nucleic acids, the kit comprising a reaction body and one or more LNAs as defined in any of the claims 60-92.

25

140. A kit according to claim 139, wherein the LNAs are immobilised onto said reactions body.
